My issue:

For my research project, the topic I chose to investigate within the natural sciences is an Earth-sized exoplanet, which is orbiting in its star's habitable zone. I find this topic significant as it can determine whether there is another planet in outer space that can support life aside from Earth.

This knowledge can potentially lead us to answers such as travel or if there are other living things.

Resource: <https://www.sciencedaily.com/releases/2020/04/200416105650.htm>

My question:

Is it possible for this Earth-sized habitable-zoned planet to be the beginning of space colonization?
