Project Proposal

- **goal statement:** Develop a web application that connects traveling users together using location proximity.
- **reflection on your motivation:** I am trying to accomplish this goal in order to connect users who want to go out and meet new people and explore with the world! Don't have anyone to go out with? Never travel alone again; and bring along your own personal ;TravelBuddy. Why? There is a big problem: Many Millenials use dating apps for building friendships or when they're traveling. Hence, No traveling apps for travelers to network!
- **ideas you've explored :**
 - I need to use the internet in order for my users to use my web application to fill out a form to open a line of communication in order to connect to other users on other servers.
 - Create a web application that will allow users to connect to other users.
 - Create a web application that will send the data using an API to update the database.

- **minimum viable application (MVA):**

- Connect Users to Other Users

- A web application that Creates and Updates Client Profile

- A web application that updates Client Profiles Location based on current proximity.

- **definition of success:** I will be successful in my project when I have a working minimum viable application that has sent over information successfully to a database or updated a clients profile. Or when working on geolocation, I am able to pull users' correct location, and update it on my web application.
