Center for Creative Leadership
Greensboro, North Carolina

The Center for Creative Leadership is an international, nonprofit educational institution founded in 1970 to advance the understanding, practice, and development of leadership for the benefit of society worldwide. As a part of this mission, it publishes books and reports that aim to contribute to a general process of inquiry and understanding in which ideas related to leadership are raised, exchanged, and evaluated. The ideas presented in its publications are those of the author or authors.

The Center thanks you for supporting its work through the purchase of this volume. If you have comments, suggestions, or questions about any Center publication, please contact John R. Alexander, President, at the address given below.

Preface

In 1998 the Center for Creative Leadership (CCL) embarked on a research study designed to understand the capacities of individuals who are effective in global roles. It was created to examine the relationship between measures of effectiveness and the individual's background, personality, learning skills, knowledge of the job, and the enactment of role behaviors. Seen from a larger perspective, the study worked within the scope of more than a decade of reports, books, articles, and other work devoted to answering the questions of what individuals need to be effective managing and leading global organizations. CCL has been part of that work (see, for example, London & Sessa, 1999; Sessa, Hansen, Prestridge, & Kossler, 1999; Wilson & Dalton, 1998).

Despite all of this activity, CCL believed that there had not been a well-designed empirical study that tested the theories and investigated whether the skills and capacities that are critical to effectiveness in the global role differ from those skills and capacities critical to managerial effectiveness in a domestic role. Furthermore, if global and domestic leadership and management skills do differ, CCL wanted to determine if there were ways to develop those different skill sets in aspiring international executives. CCL took that approach partly to assist human resource professionals in multinational organizations who have been scrambling to work out staffing strategies (policies, programs, and procedures) to recruit, develop, select, and reward individuals capable of assuming responsibility for business functions across multiple country and cultural borders.

Those goals shaped the design, development, and implementation of this study, and they provide a backdrop for this documentary report.

Introduction

In the past decade an increasing number of international managers from multinational organizations have participated in development programs at the Center for Creative Leadership. These managers work across the borders of multiple countries simultaneously. Some of them are expatriates. Most are not. And although many of these managers are not wrestling with the issues of relocating and adjusting to living in a different culture, they all find themselves dealing with cultural issues—defined in the broadest context—every time they pick up the phone, log onto their e-mail, or disembark from an airplane.

Working with these managers led us to ask fundamental questions about our current understanding of managerial effectiveness and whether or not it applied to managers who work in an increasingly complex global world. We asked ourselves: What do these managers do? Is it different from the work they did when they managed in their own countries, and if it is different, how so? What does it take for them to be effective when they manage across so many countries simultaneously? What do these managers need to know in order to be effective? What do organizations need to know and do in order to select and develop people who will manage and lead effectively in the global economy? This report is our attempt to address those questions. Although it is written for scholars, the practical implications of our work have been developed and published elsewhere (Dalton, Ernst, Deal, & Leslie, 2002).

Other researchers have explored the characteristics or competencies of global managers. Gregersen, Morrison, and Black (1998), for example, conducted interviews and gathered survey data from international managers in identifying five characteristics of successful global leaders: (1) context specific knowledge and skills, (2) inquisitiveness, (3) personal character (connection and integrity), (4) duality (the capacity for managing uncertainty and the ability to balance tensions), and (5) savvy (business savvy and organizational savvy). Associates of the Hay-McBer Group conducted critical incident interviews with 55 CEOs from a variety of industries located in 15 countries to determine the critical factors predicting global managerial effectiveness (Martin, 1997). They named competencies they believed are universal regardless of context (four competencies under each of three headings labeled Sharpening the Focus, Building Commitment, and Driving for Success) and identified three kinds of competencies that vary as a function of a given cultural context (business relationships, the role of action, and the style of authority).

These two major studies reach similar conclusions regarding a proposed taxonomy of effective global managers. Our aim in this report is not to offer yet another taxonomy. Our goal is to integrate a number of theories of leadership and managerial effectiveness as they relate to management in the global role, to test the utility of these theories, and to explore the dynamics that lie beneath their taxonomies. Using a more theoretical, integrative, and quantitative methodology, we want to better understand and link some of the precursors of global managerial effectiveness.

This study investigated a large number of variables from a variety of perspectives—far too many for a single research article and in far too much detail to be of great interest to practitioners.

The purpose of this report is to provide a comprehensive review of all of the hypotheses and analyses conducted as part of our investigation—those that proved fruitful and those that did not.

Because of the complexity of this report, we offer the following road map. Following this introduction, we present and discuss our conceptual model, which we designed to help identify, appreciate, and explain the relationships among the skills, capacities, traits, and experiences managers need to be effective when their work is global in scope. The methods section relates to all subsequent chapters. We have organized the chapters following the methodology to match with our conceptual model. Each chapter presents background information on specific variables by reviewing key and relevant literature and by subsequently offering hypotheses regarding those variables, and concludes with results and a brief discussion.

Chapter 1 sets the stage by introducing the work of global managers—what they do and how it is different from managerial work in a domestic context. Chapter 2 investigates the relationship of personality to effectiveness in a global role and considers personality as a precursor to the presence of the skills and capacities necessary for effectiveness. Chapter 3 explores the relationship between learning capabilities (self-development, perspective taking, and cultural adaptability) and managerial effectiveness. Chapter 4 explores how being a *cosmopolitan*—an individual who has lived and worked in many countries and speaks a number of languages—may increase the likelihood for effectiveness in a global role. Chapter 5 focuses on the influence of workgroup heterogeneity and homogeneity on effectiveness—does experience in managing a diverse workgroup in a domestic role increase the likelihood that an individual will be effective in a global role? The final chapter concludes with a discussion of what global managers do, what it takes for a manager to be effective when the work is global in scope, and how global managers can be selected and developed.

This report is written for our academic colleagues and for research-oriented practitioners. It is our hope that other researchers will find our conceptual model useful and intriguing enough to continue the exploration.

Model

To create our model we turned to the literature and identified those variables that have demonstrated links to managerial and leadership effectiveness, including: role behaviors (Mintzberg, 1973), coping with pressure and adversity, integrity (Kaplan, 1997), knowledge of the job (Kotter, 1988), and personality (Barrick & Mount, 1991; Salgado, 1997).

We added other variables to our model that the literature and our experience led us to suppose might be particularly salient for international jobs. These included learning capacities (Spreitzer, McCall, & Mahoney, 1997) and three additional experience-based variables. One, *cosmopolitanism,* depicts an individual's exposure to other languages and cultures during childhood and adolescence; the other two variables we called cultural heterogeneity and organizational cohort homogeneity. We defined *cultural heterogeneity* as an individual's experience with man-

aging diverse groups while managing within his or her own country. *Organizational cohort homogeneity* explores the influence of workgroup similarity on perceptions of effectiveness. In other words, we explored the effects of managers' demographic similarity (for example, number of years with company, national culture) to their cohort on how effective they were perceived to be.

Figure 1
A Conceptual Model of Predictors of Managerial Effectiveness in a Global Context

---
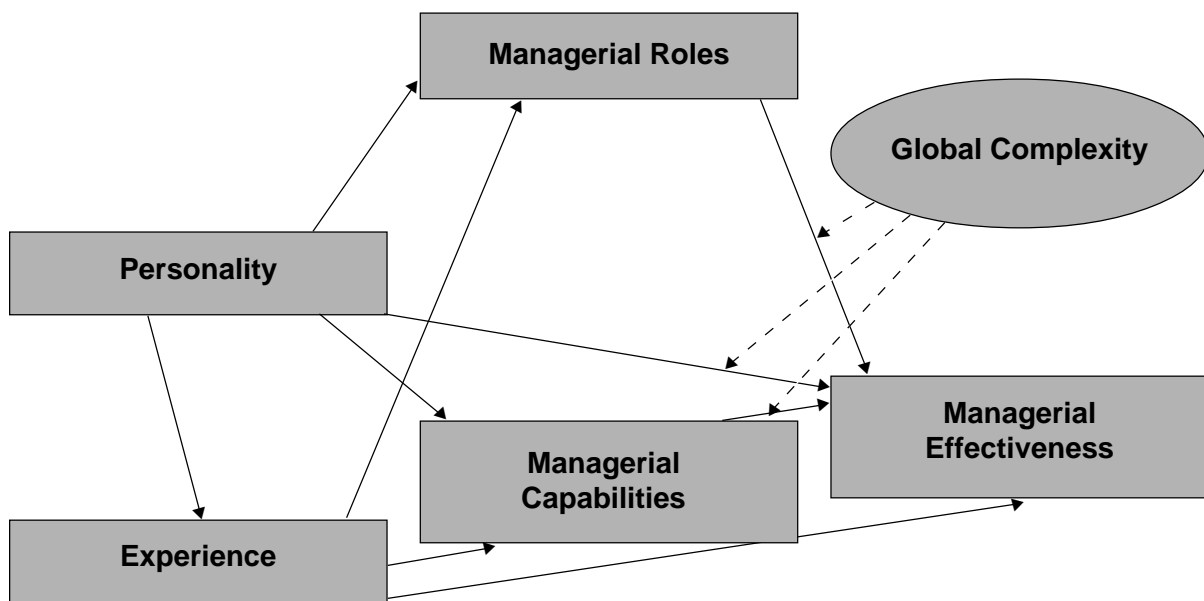

Our model (Figure 1) is conceptual, not statistical. *Personality* stands for an individual's enduring traits that might help explain the kinds of experiences to which he or she is drawn and the kinds of capabilities and role behaviors he or she is most likely to have acquired.

Experience refers to those experiences and demographic variables that individuals bring with them to the job. Experience may be critical in understanding why one manager is comfortable with the unfamiliar factors inherent in global work but another manager is not. Experience may also influence the skills and capacities a manager has acquired over time.

Managerial capabilities includes three major categories of skills: *learning behaviors, resilience,* and *business knowledge*. *Learning behaviors* include the motivation and skill to work and learn across cultural differences, the willingness to take the perspective of others, and the capacity to learn from workplace experiences. These variables have held a tacitly strong position in the management-development literature and some of the global-management literature. *Resilience* refers to the ability to manage time and stress, factors that might be more salient when the management task is global in scope. The third skill group, *business knowledge*, represents knowledge of the business and business practices. We did not write specific chapters about business

knowledge and resilience. Also not discussed here in any detail is the variable *cognitive ability*. We believe cognitive ability to be important to global managerial effectiveness, but because of the plethora of existing literature on the subject, and because of the difficulty in measuring the construct in a survey design, we excluded it from this paper.

Managerial roles stands for those behaviors that managers employ to carry out the basic functions of their work: managing relationships, managing information, and managing action. Current thought suggests that although all of the roles are important, the need for a manager to enact a particular role shifts as a function of context. Managerial work in an international business represents a particular type of context.

Global complexity represents the context of interest. We maintain that when the manager's work is global in scope, the relationships of these variables to measures of effectiveness and to one another will be different from what they would be if the manager's work were local in scope. We have operationalized global complexity as the additive function of having to manage across distance, country, and culture. The greater the time and geographical distances and the more countries that fall under a manager's scope of responsibility, the greater the global complexity of the work. Thus, temporal, geographical, and cultural complexity separate low global complexity (domestic work) from high global complexity (global work).

Methods

The methodology described in this section pertains to all following chapters, which address specific parts of the conceptual model. Two hundred eleven managers from four organizations participated in our study. All managers included were approximately at the same organizational level. Ninety-eight of the managers were from a Swiss pharmaceutical company. Twenty-five worked for a U.S. high-tech manufacturing firm. Forty-eight worked for a Swiss hospitality and service organization, and 40 worked for a Swedish truck-manufacturing organization.

Group Assignment

We used two items from our biographical measure to classify managers into either a low- or high-global-complexity group. The first item ("In how many countries are you a manager?") allowed the following responses: (a) one country—I am not an expatriate, (b) one country—I am an expatriate, (c) more than one country on the same continent, and (d) more than one country on different continents. The second item ("In how many time zones do you work?") allowed six responses: (a) 1, (b) 2, (c) 3, (d) 4, (e) 5, and (f) 6 or more. In tandem, these two items formed a proxy measure we used to assess the level of global complexity inherent in a manager's role.

To form the low- and high-global-complexity groups, we took the following steps. First, we put both items on the same 4-point metric to give them equal weight in an additive function. Specifically, the item addressing number of time zones was collapsed from 6 to 4 points. Responses (a) and (f) were kept as unique categories (representing the low and high extremes of the value, respectively), and responses (b) and (c) and (d) and (e) were collapsed to form two middle-

range values. Second, the two items were summed (range = 2–8). Third, the median for the sample was calculated (median = 3). This procedure resulted in the formulation of two groups, a low-global-complexity group with values from 2 to 3 (n = 110) and a high-global-complexity group with values from 4 to 8 (n = 101).

Sample Characteristics

Both samples were predominantly comprised of well-educated white males with a mean age of 44 in the low-global-complexity group and 45 in the high-global-complexity group. The majority of managers in each group were educated in only one country. Members of the high-global-complexity group had been in their current jobs for less than a year. Managers in the high-global-complexity group were also more likely to have been expatriates in the past than were those in the low-global-complexity group. Although 41 countries were represented in the total sample, 43% of the group were Northern European by birth (German, Swedish, Swiss) and 18% were U.S. citizens by birth. Those percentages were reflective of the corporate headquarters' locations of the four participating organizations. Participants lived in 30 countries at the time of the study, with 66.9% living in Switzerland, Germany, Sweden, or the United States. Considering the split between low and high global complexity, individuals in the high-global-complexity sample were proportionately more likely than the low-global-complexity sample to speak English (39%) or French (10%) as their native language. The individuals in the low-global-complexity sample were proportionately more likely than those in the high-global-complexity group to speak German (33%) or Swedish (18%) as their native language.

Standardization of Data

We investigated the influence of native country of target manager (culture) and organization type on the criterion measures to determine the need to standardize the data from the four organizations before merging it.

Using the native culture of participants, we created a measure to represent cultural regions (Ronen & Shenkar, 1985). The regions included Anglo (n = 63), Germanic (n = 68), and Nordic (n = 37). This accounted for 167 of the participants. Other regions—Arab (n = 3), Far East (n = 5), Latin European (n = 9), Latin American Spanish (n = 6), Near Eastern (n = 2), and Independent (n = 9)—were not used due to the small sample size. We then conducted a one-way ANOVA between groups to compare means of the three regions on the managerial effectiveness ratings. No differences were found in criterion scores as a result of the cultural region of the target manager.

We repeated this analysis to assess the impact of *organizational type* on ratings (*location of headquarters* was partly confounded with *organizational type* because the pharmaceutical and service industry companies had corporate headquarters in the same country). *Organizational type* included pharmaceutical (Switzerland), high-tech manufacturing (United States), service (Switzerland), and truck manufacturing (Sweden). Again, we found no differences from the boss's perspective. Nonetheless, these data were standardized within the four organizations

before merging the four data sets. Standardizing the data within organizations helped to control for variation due to organizational culture, business and economic context, and industry type.

Measures

Independent variables.

Personality measure. The NEO PI-R was used to represent the personality conceptualized as the five-factor model (FFM), which groups personality traits into five domains (Costa & McCrae, 1992). Each domain is made up of six facets or subscales and these six facets define each of the factor domains. The NEO PI-R was chosen because of its psychometric integrity and because extensive research has demonstrated that these five factors do appear to be universal, if not all-inclusive, across cultures (McCrae & Costa, 1997). (See Chapter 5 for further details. Alphas for the five factors are provided in Appendix B.)

Demographics. Each manager filled out a biographical form indicating gender, age, native language, country of birth, and race or ethnic origin.

Experiences. Each manager filled out a biographical form indicating tenure, years in current role, expatriate experience, languages spoken in the course of doing work, languages spoken before age 13, number of countries lived in, country currently living in, years of formal education, number of countries educated in, and major field of study. Managers were also asked to indicate for their most recent domestic job the relationship, sex, race or ethnic origin, age, native country, country of current residence, and functional area for ten members of their workgroup.

Roles. We used a measure of 75 items to represent role behavior. We derived these items from an existing instrument, SKILLSCOPE (Kaplan, 1997), and from our review of the literature. Of the 75 items, 9 were dropped during preliminary analyses due to poor item-total correlations. For data reduction purposes, the remaining 66 items were subjected to a principal component analysis (principal axis method, with orthogonal rotation). When requesting a 7-factor structure, 50 items loaded cleanly on their expected factor. We used inferences taken from the data and our conceptual understanding of the items on the remaining 16 items to incorporate an additional 6 items into the 7 scales. The remaining 10 items were dropped from subsequent analyses. (See Chapter 1 for a complete discussion of role importance and effectiveness.)

Capabilities. Capabilities comprised three sets of scales: *learning, knowledge*, and *resilience*. We used 37 items to represent the learning constructs. We derived these items from existing instruments (SKILLSCOPE: Kaplan, 1997; Prospector: McCall, Spreitzer, & Mahoney, 1997) and our review of the literature. Following the same analytic strategy previously described for roles, a request for a 3-factor solution resulted in 28 items loading on their expected factor. The remaining 9 items, which did not load in a meaningful way on any given factor, were dropped. A further investigation of the items representing the intercorrelations of the learning scales *cultural adaptability* and *perspective taking*, and the knowledge scale *international business knowledge*, suggested that further data reduction might be appropriate. A factor analysis of the scales for *perspective taking*, *cultural adaptability*, and *international business knowledge* produced a more conceptually satisfying and parsimonious solution. In the final analysis we used 10 items to

represent the construct *international business knowledge*. We used 5 items to represent the construct *cultural adaptability*. Four items were used to represent the construct *perspective taking*. The remaining items were dropped from further analysis.

Eight items were used to represent the *knowledge* construct. Four items were used to represent the *insightful* construct. These items were derived from an existing instrument (Prospector: McCall, Spreitzer, & Mahoney, 1997) and our review of the literature.

Four items were used to represent the resilience construct *coping*. Seven items were used to represent *time management* and three items were used to represent *integrity*. We derived these items from SKILLSCOPE (Kaplan, 1997) and our review of the literature. (Scales, items, and alphas can be found in Appendix B.)

Dependent variables. Managerial effectiveness as depicted in our model (Figure 1) represents the observable things that people do related to stated goals. Additionally, job effectiveness is held to be multidimensional. A criterion taxonomy—a listing of the multiple facets of effectiveness—is a more precise means of organizing links between the specific predictors and specific effectiveness criteria rather than between predictors and overall effectiveness (Campbell, McCloy, Oppler, & Sage, 1993). To represent managerial effectiveness, 27 items were gathered from the literature, then supplemented and revised in consultation with one of the companies that sponsored the research project. The 27 items were written to address three dimensions of managerial effectiveness: business practices and outcomes, managerial and leadership qualities, and relationships.

Further analysis and discussion by the research team suggested that these dimensions were better represented as five factors rather than three. We derived the final five dimensions of managerial effectiveness using three steps:

1. We conducted a principal components analysis at the individual-rater level with boss and direct report ratings combined (747 observations). Fifteen items loaded cleanly on one of five factors.
2. After a series of discussions related to the data and/or our conceptual understanding, we incorporated from the remaining 12 items an additional 9 items into the 5 scales. Three items were dropped.
3. The five derived scales and corresponding items were e-mailed to a group of CCL faculty members, who were asked to provide a name for each scale.

These steps resulted in the final five dimensions of managerial effectiveness. The first scale was called *managing and leading*. It represented the traditional leadership behaviors of setting direction, inspiring, and motivating. It also included items that reference an internal focus and traditional manager-to-direct report activities, such as selection, development, coaching, and managing conflict. The second scale was called *interpersonal relationships*. This scale represented relationships with peers and senior managers inside the organization. The third scale was called *knowledge and initiative*. These items combined the characteristics of broad knowledge and professional competence with the personal attributes of confidence, independence, and initiative. The fourth scale was called *success orientation*. This scale represented an orientation toward goal achievement and attainment of desired organizational outcomes. It also included an

item related to the potential to reach the most senior job in the company. The fifth scale, *contextually adept*, had an external focus and included items related to the ability to manage external relationships. (Scales and alphas can be seen in Appendix B.)

Data Collection

Participating managers completed the 240-item personality measure (NEO PI-R), the biographical form, and the measure of role skills and capabilities. The surveys were all in English. Managers were assured that their individual results would be available only to the research team. On the personality measure managers rated themselves on a 5-point scale ranging from strongly disagree to strongly agree.

On the measure of role skills and capabilities managers first rated each item on a 3-point scale ranging from (1) *this is not important to my current job* to (3) *this is extremely important to my current job*. They then returned to the items and rated their own skill at performing each of the behaviors on a 5-point scale ranging from (5) *this skill or perspective is one of my greatest strengths* to (1) *this skill or perspective is something I am not able to do*.

Bosses responded to the 27-item effectiveness statements on a 5-point scale ranging from strongly agree to strongly disagree. A *not applicable* response category was provided. This measure was in English. Responses were returned directly to CCL. Respondents were assured that their individual responses would remain confidential to the research team.

Although boss and direct report ratings were obtained, direct report ratings are not discussed in this report. Early examination of the direct report ratings in the high-global-complexity condition offered little to enhance our understanding because, like most multiperspective ratings, these respondents see things differently. Our focus turned to the perspective of the boss because it provided the best position for commenting on effectiveness under different conditions. The direct report ratings were dropped from the remaining report; however, the correlation matrices can be found in Appendices E and F. (See Appendices C–F for alphas and intercorrelations of all the measures by rater source.)

Conclusion

The methodology discussed in this section relates to the results and discussion that make up the remainder of this publication (excluding appendices). As described earlier, Chapter 1 introduces the work of global managers—what they do and how it is different from managerial work in a domestic context. Chapter 2 focuses on the relationship of personality to effectiveness in a global role. Chapter 3 explores the relationship between learning capabilities (self-development, perspective taking, and cultural adaptability) and managerial effectiveness. Chapters 4 and 5 introduce the variables of experience into the model—life experiences related to the number of countries in which a manager has lived or worked, the number of languages a manager speaks or reads, and work experiences such as the influence of diversity on a global manager's effectiveness. Chapter 6 offers a general discussion of the findings as they relate to the conceptual models, and draws some conclusions about what those findings have to say about managerial effectiveness in a global context.

CHAPTER 1
Managerial Roles—Similarities and Differences in Domestic and Global Work

The evolution of managerial models over the course of the twentieth century reveals that the manager's reality has increased in complexity. During the first quarter of the century, Taylor (1911) and Fayol (1949) appropriately described the nature of work during the Industrial Revolution and portrayed the manager as one who plans, organizes, commands, coordinates, and controls. The next 25 years brought greater recognition to the social context of work and the introduction of human-relations models (Barnard, 1938; Mayo, 1933). These approaches stressed that managerial responsibility went beyond productivity and efficiency to include the need for attention to human relationships.

Managerial models shifted once again during the quarter century following World War II. In an attempt to explain a managerial environment characterized by increasingly unpredictable and unstable environments, writers such as Katz and Kahn (1978) and Lawrence and Lorsch (1967) developed an "open systems" approach to evaluate organizational dynamics. These frameworks were consistent with the growing movements toward contingency theories and lent credence to the importance of context in understanding managerial behavior (Quinn, 1990).

As the last quarter of the century drew to a close a new managerial reality emerged: the global manager. In addition to all that came before, temporal, geographical, and cultural complexity were added to the core of a manager's work. These historical shifts have challenged scholars to reconsider their understanding of the nature of managerial work. Theoretical models have become inadequate, failing to address the heightened complexity of increasingly global business contexts. A conceptual framework has become necessary for designing appropriate selection or training systems for developing global managerial talent. The current challenge to understand these changes is captured in two questions:

1. What do global managers do?
2. Is it any different from what domestic managers do?

Background

In addressing the question "What do global managers do?" we place our conceptualization of global complexity within the established literature on managerial roles (see Figure 2, p. 10). We begin by considering the recent literature's portrayal of managerial roles. We follow with a model based on the work of Mintzberg (1973, 1994), which we use to evaluate managerial behavioral roles. We then suggest why this framework is useful for studying work that is globally complex. Finally, we consider how the context of global complexity can affect the extent to which certain behavioral roles are perceived as being relatively more or less important for managerial effectiveness. It is our belief that while some roles may be perceived equally regardless of the level of global complexity, other roles will be seen as increasingly important as the demands of work shift from a domestic to a global context.

Figure 2
**A Conceptual Model of Predictors of Managerial Effectiveness in a Global Context
(Managerial Roles)**
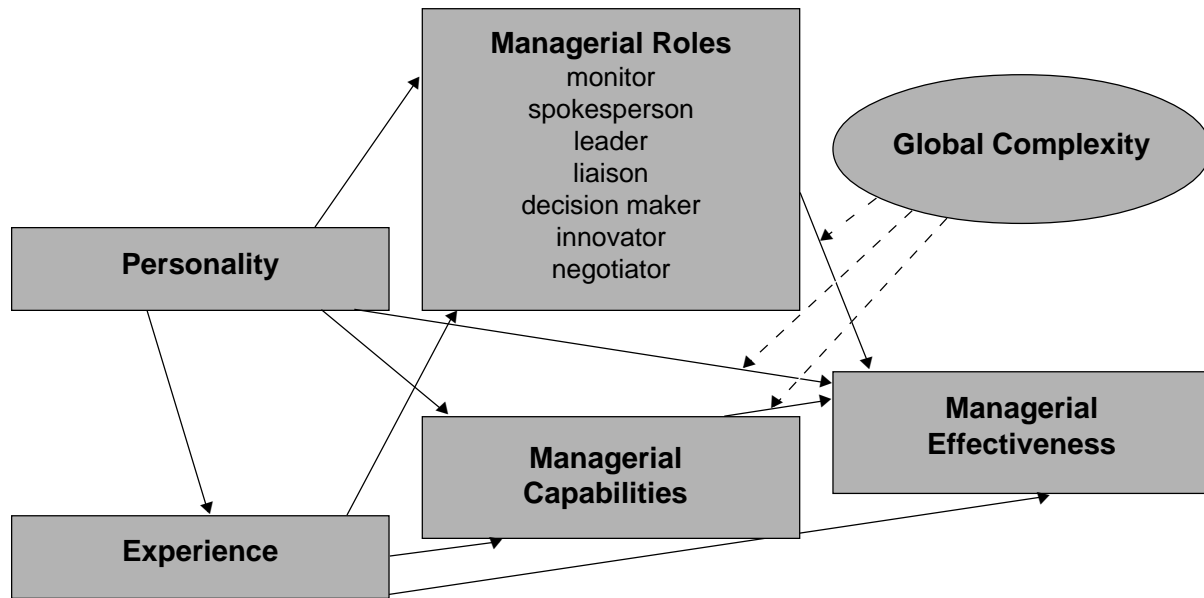

Considerable debate exists over the question of what domestic and global managers do. Some global theorists have argued that there is little difference. Others have suggested that noticeable differences exist both in scale (the global manager does more) and in quality (the global manager performs at a higher level). Recent writings have characterized global managers as "cultural synergizers" (Adler & Bartholomew, 1992), "true planetary citizens" (Roddick, 1991), "cross fertilizers" (Bartlett, Doz, & Hedlund, 1990), and "perpetual motion executives" (Malone, 1994). These colorful descriptions further suggest distinct roles and job content for global managers.

Other research suggests that global work is the same as other types of managerial work, but that its level of difficulty is substantially greater (see, for example, Adler & Bartholomew, 1992). In 1994 Bartlett and Ghoshal suggested that the nature of global work is so complex that there is no such thing as a universal global manager. They recommended that an organization create three groups of global specialists—business managers, country managers, and functional managers—to lead the organization toward achieving its global strategy. Alternatively, Kanter (1995) wrote about a few but increasing number of global cosmopolitans who develop "world class" competence over crucial globalization processes.

A model of managerial roles. In 1973 Mintzberg delved into an important but rarely investigated question: "What does a manager do?" He conducted an ethnographic study of managers in five organizations. His observations led him to a framework for management that differs radically from those of many past and present leadership theorists. It described managerial

activities as being fast paced, brief, varied, and discontinuous. In this framework managers have little time for reflection, and their work gravitates toward action and simply getting things done.

Mintzberg (1973) further described work activities as contained within a set of ten behavioral roles. He organized his ten roles into three groups: informational roles (monitor, disseminator, spokesman) that require a manager to monitor, communicate, and manage information; interpersonal roles (figurehead, leader, liaison) that require a manager to act with and through others to get things done; and action roles (entrepreneur, disturbance handler, resource allocator, negotiator) that require a manager to negotiate and make decisions. These roles were not discrete or mutually exclusive but integrated parts of a whole. Mintzberg argued that effective managers often combine and perform several roles simultaneously.

In a follow-up investigation Mintzberg (1994) kept the three overarching groups (informational, interpersonal, and action), but collapsed the ten roles into six. Based on our analyses of the data in our study (and incorporating Mintzberg's 1973 and 1994 work), we incorporated seven roles into our research:

Informational Roles
1. Monitor: scan environments, monitor units, probe and seek information, act as corporate nerve center of incoming information.
2. Spokesperson: communicate and disseminate information with multiple levels of the internal and extra-organizational system, advocate and represent the organization.

Interpersonal Roles
3. Leader: motivate, coach, build teams, maintain corporate climate and culture, and supervise the work of others.
4. Liaison: network, coordinate, link entities, and span organizational boundaries.

Action Roles
5. Decision maker: take action, troubleshoot, make decisions, and use power to get things done.
6. Innovator: try new approaches, seize opportunities, generate new ideas, and promote a vision.
7. Negotiator: make deals, translate strategy into action, negotiate contracts, manage conflict, and confront others.

Other leadership and management scholars have also defined managerial roles (House & Mitchell, 1974; Luthans & Lockwood, 1984; Morse & Wagner, 1978). Quinn (1990) specified eight interconnected roles that effective managers perform: director, producer, monitor, coordinator, facilitator, mentor, innovator, and broker. Yukl (1989) integrated several decades of managerial-role research into a taxonomy of managerial behavior. A role-based framework is consistent with Katz and Kahn's open systems approach (1978), in which roles are determined by inputs from the environment as well as variations in style as determined by the individual. They

defined behavioral roles as the "recurring actions of an individual, appropriately interrelated with the repetitive activities of others so as to yield a predictable outcome" (p. 125). We have defined a role as a set of behaviors that belong to an identifiable position, believing that roles identify a limited and connected set of behaviors. But does the construct of roles hold when managerial responsibility transcends temporal, geographical, and cultural distance?

The universality of managerial roles. While acknowledging that some researchers argue against a universal theory of management (Dorfman & Howell, 1988; Hofstede, 1980), we contend that the construct of roles has universal value. We agree that managerial work is vastly different in many parts of the world and that on a global scale there is no one best way of doing anything. Yet we also feel that role-based theories of managerial work are successful in describing managerial work in a diverse, pluralistic world.

Behavioral roles describe what a manager does. In our investigation of managerial roles we have focused on *what* managers do, rather than the why or how behind the activities that comprise the complete set of managerial roles. Although we believe that the latter issues are significantly affected by variations in cultural beliefs, values, and norms, we feel that the issue of what managers do more directly reflects the content of managerial work.

We recognize that, beyond societal culture, the organizational climate and culture affects managerial roles, as does variations in managerial style. We expect these differences to influence the extent to which certain role behaviors are more or less descriptive of managerial effectiveness. We also argue that in a globally complex environment managers are challenged to perform more roles and devise new roles not captured by our current role-behavior models.

Akin to Bass's (1997) position concerning the possible universality of transformational leadership, we believe managerial roles demonstrate "not a constancy of means, variances, and correlations across all situations, but rather an explanatory construct good for all situations" (p. 130). We submit that to conceive management as a series of unfolding roles is good for all situations. With this understanding we now consider how the context of global complexity may impact the roles that a manager plays.

Similarities and differences in global and domestic work. Mintzberg (1994) argued that although all managers perform a series of roles, that does not suggest that all managers perform the same roles in the same manner. Specifically, he suggested that aspects of the work varied depending upon four sets of variables: environment (differences in milieu, the industry, and the organization), job (differences in job level, such as middle or top management, and function, such as marketing or sales), person (differences in personality and style characteristics of the manager), and situational (differences in temporal and contextual features—seasonal variations or temporary crises, for example).

Each of these four variables is expected to influence the degree and extent to which managers exhibit the various roles. Because of differences in job functions, line managers, for instance, are expected to spend more time in the action roles (negotiator, decision maker), whereas human resource specialists are expected to pay greater attention to the informational roles (monitor, disseminator). Likewise, a team manager will tend to emphasize relational roles (leader, liaison).

These examples illustrate how the four variables impose greater or lesser attention to various aspects of the work. This framework has provided a rich backdrop from which organizational researchers have investigated differences in managerial roles.

Mintzberg's job variables have dominated the attention of researchers and have been studied both in terms of hierarchical level (Lau & Pavett, 1980; Pavett & Lau, 1983; Sen & Das, 1990) and functional area (McCall & Segrist, 1980; Paolillo, 1987). Pavett and Lau (1983) found significant differences between top- and lower-level managers on eight of the ten Mintzberg roles and differences between middle- and lower-level managers on six of the ten roles. Other studies have considered the person variables in terms of gender differences (Smith & Schellenberger, 1991) as well as age, tenure, and educational level (Beggs & Doolittle, 1988).

Less research has been conducted regarding the situational and environmental variables, but there is one study of direct interest to the work documented in this report. Gibbs (1994) organized Mintzberg's environmental variables in terms of two constructs: complexity (the number of elements in which managerial interaction is required) and dynamism (the rate of change between these elements). Combinations of these variables produced a 2 x 2 matrix (stable-simple, stable-complex, dynamic-simple, dynamic-complex) that allowed Gibbs to test for both direct and indirect effects. The overall pattern that emerged from the two organizations sampled suggested that (a) complexity increases the frequency of informational roles, (b) complexity and dynamism increase the frequency of action roles, and (c) dynamism increases the frequency of relational roles; however, this relationship is moderated by complexity such that relational roles are more frequent in complex environments as opposed to simple environments. Gibbs concluded that current "trends toward the computerization of the technical core, the globalization of many businesses, and the increase in education of the workforce . . . implies that the environment and technology will increasingly be better predictors of managerial-role activity than previous hypotheses of functional area, level in hierarchy, or other internal structural dimensions" (p. 601).

We agree with Gibbs's conclusion and feel confident that in today's business environment, variations in situation and environment are as compelling in explaining managerial work as are differences in job and person. *Global complexity,* defined in terms of temporal, geographical, and cultural distance, clearly implies environmental and situational difference. Consistent with Mintzberg, we would expect that although the requisite behaviors are generally the same, the importance of these behaviors may shift according to variations in global complexity.

Hypotheses

Informational roles. Informational roles require managers to monitor information both inside and outside the organization, and then disseminate this information as a spokesperson for the organization. In such roles managers are not working directly with people or with actions but instead are using information as an indirect way to make things happen. Given the tremendous information flows of the global business environment, we expect global managers to attribute more importance to the roles of monitor and spokesperson.

The periphery of the global organization is marked by continual change in technology, competitors, customers, suppliers, and products. These movements push to create new business advantages and new growth markets. In this fast-paced and competitive environment, global managers are required to process, integrate, and communicate based on significant amounts of disparate information.

Bartlett, Doz, and Hedlund (1990) have stated that within interdependent and geographically dispersed global organizations, global managers serve as "cross-fertilizers" who create the glue that melds a shared vision, strategy, and norms. Global managers cannot just articulate the corporate vision, but must also encourage the flow of local, tacit information throughout the organization. Global managers have also been described as "cross-pollinators," "global scanners," and "cultural synergizers" (Adler & Bartholomew, 1992). Bartlett and Ghoshal (1994) identified one type of global manager, the functional manager, who scans across the organization to cross-pollinate ideas and champion innovation. The context of global complexity suggests increased attention to the roles of monitor and spokesperson as global managers seek to act as the organizational gatekeepers. As for the informational roles, we predict

> HYPOTHESIS 1.1: Managers in contexts of high global complexity will attribute more importance to the roles of monitor and spokesperson than will managers in contexts of low global complexity.

Relational roles. Relational roles require managers to coach, motivate, and supervise the work of others, and to network, coordinate, and span organizational boundaries. "To manage through people, instead of by information, is to move one step closer to action, but still remain removed from it," Mintzberg has stated. "That is because here the focus of managerial attention becomes affect instead of effect" (1994, p. 18). Several organizational researchers, such as Gregersen, Morrison, and Black (1998), have suggested that a global manager's savvy concerning interpersonal or relational skills can spell the difference between success and failure in the global environment. We believe that although the role of leader will not differentiate between domestic and global work, the role of liaison will become increasingly important in global settings.

In focusing on the importance of role behaviors, we are considering the actual nature or content of the work rather than the level of skill required to effectively do the work. We agree that interpersonal competence is a hallmark of effective global leadership, and we have included several relational-based variables in our research—for example, the learning capability of cultural adaptability, the personality characteristic of agreeableness, the experiential variable of cosmopolitanism—that we believe will be important indicators of effectiveness when managers are working globally. However, we do not believe that behaviors descriptive of the leader role—such as coaching and mentoring, inspiring and delegating, and building teams and supervising others—become differentially more important when work responsibility moves from a domestic to a global context.

Malone (1994) used personal accounts to describe how global "perpetual motion executives" work and manage the work of others from long distance. He described typical norms such as handling 40–75 e-mail messages daily, having face-to-face contact with direct reports once every six weeks, and working in airplanes and from airports. These norms unquestionably put added stress on the traditional supervisor-direct report relationship. Maintaining strong working relationships is critical to both domestic and global managers, and it's made more difficult for global managers who must find ways to maintain these relationships across distance, countries, and cultures.

In contrast, we see the relational role of liaison as more important in globally complex work. During the 1990s multinational firms gained access to more than a billion new customers in remote and emerging economies (Prahalad & Oosterveld, 1999). Strategy theorists have stressed the extent and speed with which global organizations must consummate relationships leading to mergers, acquisitions, joint ventures, alliances, and licensing arrangements.

Kanter (1995) has said that world-class executives and organizations are defined by the presence of concepts (the best and latest knowledge and ideas), competence (the ability to perform according to best-in-world standards), and connections (a set of relationships providing access to global resources). To form connections, global managers forge relationships that span companies and countries to bring collaborative advantage to the organization. Ohmae (1990) wrote about the power of joint ventures and consortiums to develop insider status within North America, Western Europe, and Asia. Perlmutter and Heenan (1994) suggested that global cooperation between firms is best achieved through global strategic partnerships. These business imperatives suggest that the role of liaison will take on heightened importance for the work of the global manager. For the relational roles, we predict

> HYPOTHESIS 1.2: Managers in contexts of high global complexity will attribute more importance to the role of liaison than will managers in contexts of low global complexity, but managers in both contexts will perceive the role of leader equally.

Action roles. In the action roles—decision maker, innovator, and negotiator—managers are required to make decisions, resolve crises, seize opportunities, negotiate contracts, and manage conflict. As Mintzberg stated, "if managers manage passively by information and affectively through people, then they also manage instrumentally by their own direct involvement in action" (1994, p. 20). We believe that, counter to the previous sets of roles (managing information and managing relationships), the action roles will not differentiate in importance between managers in contexts of low and high global complexity.

In a study within several major global organizations, Yeung and Ready (1995) identified six qualities that organizations value in global managers: (1) to be a catalyst/manager of strategic change, (2) to be a catalyst/manager of cultural change, (3) to articulate a tangible vision, values, and strategies, (4) to exhibit a strong customer orientation, (5) to empower others to do their best, and (6) to get results. A close reading of these characteristics suggests a type of management

responsibility that is noticeably removed from the day-to-day action of the organization. Rather than managing actively through direct involvement, the demands of global work may move to isolate the global manager, at least in part, from the daily operations of the organization.

As an organization's strategies and systems globalize, its key organizational characteristic is to operate across national boundaries, simultaneously achieving global integration while retaining local differentiation. In a strategy of global integration, successful multinationals seek the advantages of local differentiation (Bartlett & Ghoshal, 1989). This requires strong and empowered local managers who understand local needs and interests. As suggested by Quelch and Bloom, overemphasizing global integration leads to management that lacks the "geographic knowledge, political know-how, flexibility, and cultural sensitivity to assess the evolving environment and take appropriate action" (1996, p. 32).

The strategy of global integration and local differentiation suggests that significant decision-making and negotiating responsibility should be held at the level of the local market. Ohmae (1990) has written that firms only achieve insider position when they entrust local managers who are familiar with and responsive to local conditions. Certainly, the work of the global manager requires significant attention to such behaviors as making decisions, negotiating contracts, generating new ideas, and managing conflict. Yet, from the standpoint of what managers do, we believe that the responsibility of the global manager does not require differentially more attention to the action roles of decision maker, innovator, and negotiator. For the action roles, we predict

> HYPOTHESIS 1.3: Managers in contexts of high and low global complexity will perceive the roles of decision maker, innovator, and negotiator equally.

Role skill and managerial effectiveness. In addition to focusing on what global managers do (role importance), we also want to better understand the skill that managers bring to those roles in settings of low and high global complexity and how those role skills relate to managerial effectiveness. As Figure 1 illustrates, we intend to examine both the independent and shared relationships between managerial role skill and the other variables in the model. Under this line of investigation, our question of interest is not "What do global managers do?" but rather "How is what global managers do related to perceptions of their effectiveness?"

Although Mintzberg's (1973) model is descriptive (describing what managers do) rather than prescriptive (predicting determinants of managerial effectiveness), it is clear from his framework that effectiveness centers upon the ability to perform multiple roles. That is also our position. We are interested in determining whether a specific role, or group of roles, is critical for effectiveness in global managerial settings. We are also interested in determining whether these relationships are the same or different compared to managers working in a context of low global complexity. Based on the pattern of results presented below for role importance, we propose the following hypotheses:

HYPOTHESIS 1.4: The role of *monitor* will be related to the effectiveness criterion *contextually adept* for managers in contexts of low and high global complexity.

HYPOTHESIS 1.5: The role of *spokesperson* will be related to the effectiveness criterion *contextually adept* for managers in contexts of high global complexity.

HYPOTHESIS 1.6: The role of *leader* will be related to the effectiveness criterion *managing and leading* for managers in contexts of low global complexity.

HYPOTHESIS 1.7: The role of *liaison* will be related to the effectiveness criteria *contextually adept* and *interpersonal relationships* for managers in high-global-complexity jobs.

HYPOTHESIS 1.8: The role of *decision maker* will be related to the effectiveness criteria *knowledge and initiative* and *success orientation* for managers in low- and high-global-complexity jobs.

HYPOTHESIS 1.9: The role of *innovator* will be related to the effectiveness criterion *knowledge and initiative* for managers in low- and high-global-complexity jobs.

HYPOTHESIS 1.10: The role of *negotiator* will be related to all effectiveness criteria for managers in low- and high-global-complexity jobs.

Results and Discussion

Role importance. Both independent sample *t*-tests and nonparametric Mann–Whitney *U* analyses were conducted to test for mean differences reported by managers in contexts of low and high global complexity on the level of importance attributed to the seven managerial roles. The nonparametric tests were conducted out of concern that the response anchors for the role importance data are not interval level. However, because the findings from the nonparametric tests are parallel to the findings from the *t*-tests, only the *t*-test results will be discussed.

The results are presented in Table 1.1. Hypothesis 1.1 was partially supported; differences were found for the spokesperson role, but not for the monitor role. Hypothesis 1.2 was partially supported. The liaison role, as expected, was perceived as being significantly more important to job effectiveness by managers in high-global-complexity jobs. Counter to expectation, managers in low-global-complexity jobs attributed more importance to the role of leader. Finally, Hypothesis 1.3 was supported; no differences were found between the two groups of managers on the three action roles.

These findings indicate that what global managers do is largely the same as what domestic managers do, but with important differences in emphasis. Managers in high- and low-global-complexity jobs did not differentiate in the level of importance attributed to the roles of monitor,

decision maker, innovator, and negotiator. Yet, the findings also highlight an interesting shift in the degree of emphasis attributed to several of the roles as work responsibilities move from low to high global complexity. Global managers emphasize less the more internal-oriented role of leader, and emphasize more the external-oriented roles of spokesperson and liaison. These findings suggest that as managerial responsibilities grow more global in scope, managers are increasingly called upon to disseminate information to a host of diverse constituents along the organizational periphery.

Table 1.1
Importance Ratings for High- and Low-Global-Complexity Jobs

Managerial roles

Monitor	NS
Spokesperson	$T = -2.84 \; p < .01$ low $= -.20$, high $= .17$
Leader	$T = 1.91 \; p < .05$ low $= .11$, high $= -.15$
Liaison	$T = -2.35 \; p < .05$ low $= -.15$, high $= .16$
Decision maker	NS
Negotiator	NS
Innovator	NS

Role effectiveness. Zero-order correlations were conducted between the seven role behaviors and the five effectiveness measures as rated by the boss for global and domestic managers. The hypotheses were based on the pattern of results found for ratings of role importance. The results for boss ratings are provided in Table 1.2.

Table 1.2
**Role-Behavior Correlations with Effectiveness Ratings for Managers in
Low and High Global Contexts**

Low global context *n* = 101	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Monitor	.15	.006	.19	.18	.18
Spokesperson	**.33**	.19	**.26**	**.26**	**.26**
Leader	**.23**a	.14	.18	.19	**.26**
Liaison	.13	.16	.15	**.21**	.13
Decision maker	**.21**	.01	**.21**a	**.21**a	**.27**
Innovator	.006	−.04	.16a	.05	.15
Negotiator	−.05a	−.02a	.13a	.07a	.11a

High global context *n* = 80	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Monitor	.11	.001	.14	.15	.04
Spokesperson	.12	−.03	.19	.01	.07a
Leader	.18	.03	**.27**	.06	.14
Liaison	−.03	.07a	.17	.13	.08a
Decision maker	.17	−.002	**.38**a	**.25**a	.17
Innovator	.09	.02	**.24**a	.10	.07
Negotiator	**.22**a	.16a	**.38**a	**.26**a	.17a

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Hypothesis 1.4 was not supported; the monitor role was not related to any of the effectiveness measures for managers in either the low- or high-global-complexity condition. Hypothesis 1.5 was not supported; counter to expectation, the spokesperson role was a differentiator of effectiveness for managers in low-global-complexity conditions rather than managers in high-global-complexity conditions. Hypothesis 1.6 was supported. Hypothesis 1.7 was not supported; the liaison role was not related to any of the effectiveness measures for managers in the high-global-complexity condition. Hypothesis 1.8 was supported. Hypothesis 1.9 was partially supported; the innovator role was related to the knowledge and initiative measure but only for managers in settings of high global complexity. Finally, Hypothesis 1.10 was partially supported; the negotiator role was related to multiple effectiveness measures for managers in high-global-complexity conditions but not managers in low-global-complexity conditions.

These results indicate that what managers in low- and high-global-complexity conditions think is important in their jobs does not correspond with what differentiates effectiveness. In hindsight this finding is not surprising given past 360-degree feedback research that demonstrates that importance and effectiveness are two separate constructs. This is perhaps especially true in the present research because managers themselves indicated importance levels while the effec-

tiveness ratings were provided by the managers' bosses. For example, the spokesperson role differentiated effectiveness for managers in the low-global-complexity condition even though the spokesperson role was endorsed by managers in the high-global-complexity condition as being relatively more important to their jobs. Interestingly, and again counter to the findings for importance, it was the action roles that served as the strongest differentiators of effectiveness for global managers. For example, the innovator and negotiator roles were uniquely related to effectiveness for managers working in contexts of high global complexity. This illustrates that new information emerges when managerial roles are viewed through the eyes of the managers' bosses.

CHAPTER 2
Managerial Traits—Personality and Effectiveness in a Global Context

This chapter of the report examines that part of the model that illustrates the relationship between personality and managerial effectiveness. It defines personality, explains why this construct belongs in the model, describes the theory of personality used in this work, and then presents the instrument used to operationalize this theoretical perspective. Included is a brief discussion about the limitations of that instrument, the theory it represents, and some potential problems in using it with a population of individuals from many countries. Further, an overview of how personality has been directly linked to effectiveness for North American and European managers in domestic roles provides a basis for hypotheses about how these relationships might change when managerial work is global in scope. Finally, a discussion of the relationship of personality factors to other variables in the model gives rise to hypotheses about how personality may be indirectly linked to effectiveness; in other words, whether individuals with a particular personality predisposition are more likely to demonstrate a particular set of leadership skills.

Background

Hall and Lindzey have described personality "as the most outstanding or salient impression that an individual creates in others" (1978, p. 7). An individual's personality is couched in terms that suggest attributes or qualities consistently characteristic of that person over time. Personality does not refer to a single trait or attribute but is a clustering of traits combined in limitless possible ways and permutations.

Although the academic literature continues to debate the relative power of personality in predicting behavior, the lay person understands personality as a set of attributes that accurately characterize a person in many (but not every) contexts over time. One describes other people based on the consistent impression they make on others and often in ways that are consistent with how those people describe themselves: "She's friendly," for example, or "He's a worrywart." If a person behaves out of character, one is likely to say, "That's not like him" or "That does not sound like her."

Figure 3
**A Conceptual Model of Predictors of Managerial Effectiveness in a Global Context
(Personality)**
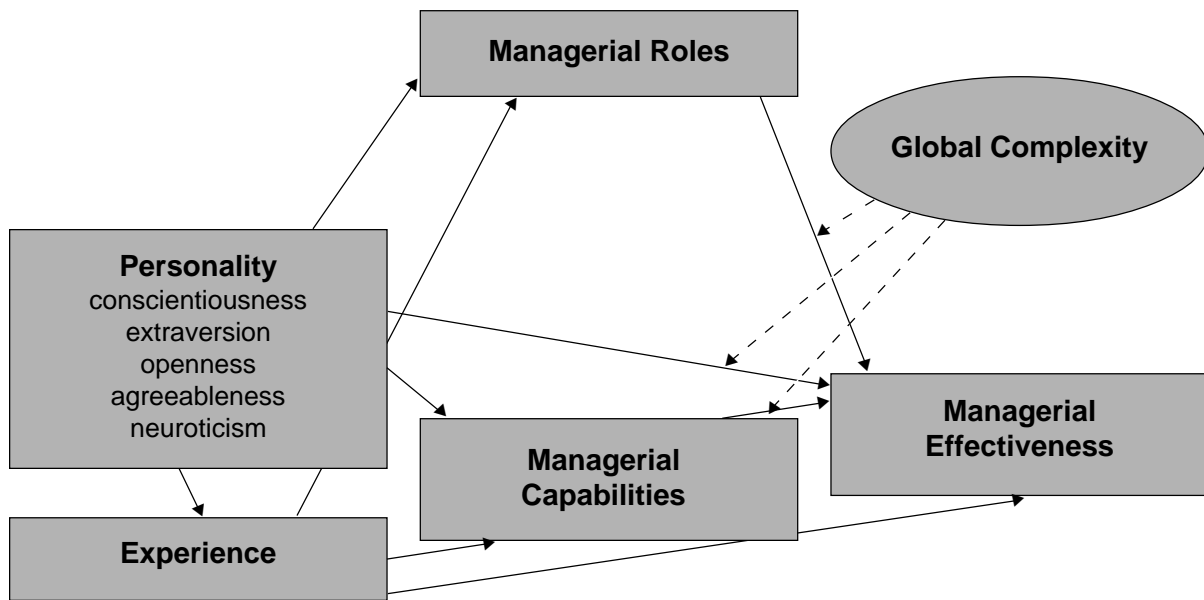

Why we have included personality in our model. The debate over the role of personality in predicting human behavior (and a subset of that behavior, managerial and leadership effectiveness) has continued for 40 years (see, for example, Guion & Gottier, 1965; Mischel, 1977; Raymark, Schmit, & Guion, 1997; Stogdill, 1974). To a great extent this debate has been an artifact of the state of the art of statistical and measurement capabilities within the field. The advent of meta-analytic statistical strategies and more precise and fine-grained measurement tools has provided a better understanding of the role that personality plays in predicting managerial and leadership effectiveness. Personality does indeed account for some, but not all, of the effectiveness variance in a variety of organizational roles.

Given that understanding, we include personality in our model for a number of reasons. For one, a growing literature points to the relationship of certain personality variables to managerial work. We wanted to understand if this holds true when the work is global in scope and when the incumbents are from a variety of countries and working across the world. We also wanted to understand the extent to which effectiveness in a global managerial role is related to stable and universal individual difference characteristics as this will have implications for selection procedures in international organizations. Additionally, we sought to understand the extent to which personality traits share variance with skills and perspectives related to effectiveness as this has implications for the developmental strategies of organizations. Finally, we wanted to be able to compare and contrast the relative contribution of experience and personality to effectiveness.

Theory and measurement of personality. For our model, we chose the Five-Factor Model (FFM) of personality as representing a comprehensive attempt to describe and measure the structure of personality from a universal perspective. The FFM presumes that a listing and grouping of the adjectives that people use to describe themselves and others will reveal the full spectrum of personality traits and attributes of a people.

Using increasingly sophisticated statistical techniques, 50 years of research based on this lexical tradition has yielded five major factors, or domains, that many theoreticians believe represent the full spectrum of emotional, interpersonal, experiential, attitudinal, and motivational traits for describing personality (Cattell, 1946; Digman, 1990; John, 1989; McCrae & Costa, 1990; Norman, 1963).

An instrument developed to represent and measure the FFM is the NEO PI-R (Costa & McCrae, 1992). The NEO PI-R presents personality traits grouped into five major factors or domains. Each factor is made up of six facets or subscales and these six facets define each of the factor domains (see Table 2.1).

<div align="center">

Table 2.1

The Five-Factor Model as Measured by the NEO PI-R

</div>

Factor	Definition	Description
(N) Neuroticism	anxiety, hostility, depression, self-consciousness, impulsive-ness, vulnerability	This personality type has a general tendency to experience negative affects such as fear, sadness, embarrassment, anger, guilt, and disgust. People with high N scores tend to be less able to control their impulses and cope poorly with stress.
(E) Extraversion	warmth, gregariousness, assertiveness, activity, excite-ment seeking, positive emotions	Extraverts are sociable. They like people, prefer large gatherings, and are assertive, active, and talkative. They like excitement and stimulation and tend to be energetic and optimistic.
(O) Openness	fantasy, aesthetics, feelings, actions, ideas, values	People with high O scores have an active imagina-tion, aesthetic sensitivity, attentiveness to inner feelings, preference for variety, intellectual curiosity, and independence of judgment. They are willing to entertain novel ideas and unconven-tional values and they experience emotions more keenly than closed individuals.
(A) Agreeableness	trust, straightforwardness, altruism, compliance, modesty, tender-mindedness	The agreeable person is altruistic, sympathetic to others and eager to help them, and trusting and cooperative rather than competitive.
(C) Conscientiousness	competence, order, dutifulness, achievement striving, self-discipline, deliberation	The person with a high C score is purposeful, strong-willed and determined, achievement oriented, scrupulous, punctual, and reliable.

Costa, P. T., Jr., & McCrae, R. R. (1992). *Revised NEO Personality Inventory (NEO PI-R) and NEO Five-Factor Inventory (NEO-FFI) Professional Manual*. Odessa, FL: PAR, pp. 14–18.

Some psychometricians and cross-cultural researchers have argued that the FFM is not a comprehensive taxonomy of personality structure. For example, one U.S. theoretician (Hogan, 1983) wrote that *extraversion* is really two factors—sociability and ambition. Hough and Schneider (1996) argued that there are nine factors—the six listed by Hogan plus achievement, masculinity, and locus of control. After reviewing these arguments, we believed that the FFM was sufficiently robust as an explanatory device for our work and that the NEO PI-R, as a representation of the FFM, addressed the comprehensiveness debate by breaking each domain or factor into six facet scales, allowing for both a broad and more detailed look at the phenomena.

The universality of the FFM. The concerns of cross-cultural psychologists as to the universality of the FFM were more critical to our work because global managers, as we defined them, are from many countries and work in many countries. It could be that a particular personality factor might manifest itself in one way with a manager from an individualistic culture and in another way with a manager from a collectivist culture (Cross, 1995). This would be particularly true if the manager's behavior were being evaluated by direct reports because cultural differences are believed to be more manifest the farther down one goes in an organization (Peterson & Hunt, 1997).

Determining how to measure a given construct when the research subjects come from a number of different countries/cultures is both controversial and difficult (see Church & Lonner, 1998; Segall, Lonner, & Berry, 1998). There are problems related to comprehensiveness and structure. There are issues related to the meaning and value attributed to the same traits across cultures. There are problems related to the scale equivalence and full-score comparability of the measurement tools across cultures.

Despite these obstacles, strong support for the universal applicability of translated versions of the FFM exists (McCrae & Costa, 1997; McCrae, Costa, del Pilar, Rolland, & Parker, 1998; Piedmont & Chae, 1997). Studies examining the structure of comprehensive collections of indigenous-trait terms have also reported good results from the use of the FFM (Church & Lonner, 1998). DeRaad, Perugini, and Szirmak (1997) identified the FFM as the best working hypothesis of an omnipresent trait structure.

But our model was not about cross-cultural comparisons. Our population of interest was made up of managers from multiple countries who manage work and people in multiple countries in international organizations. The scope of the global managers' work requires them to manage across borders in a world that has defined the language of business as English. The scope of domestic managers' work is in-country but is still part of an international organization. Our question of interest was not about cross-cultural differences but about managing across cultures. Arguments for the cross-cultural comprehensiveness of the FFM's constructs and structure only tangentially support or detract from our decision to use this theory as represented by the NEO PI-R.

We chose the English language version of the NEO PI-R as our tool for representing the construct of personality, with a respectful understanding of the drawbacks (Berry, 1990). Our choice was based on the premise that the traits represented by the NEO PI-R will predict manage-

rial effectiveness in organizations regardless of the manager's cultural influences or country of origin. Granted, there may be indigenous traits that would predict effectiveness for domestic managers working in homogeneous groups in their own country. But we decided that the FFM will make meaningful predictions of effectiveness for English-speaking managers regardless of their country of origin or the country in which they might be working.

The relationship of personality to job effectiveness and managerial effectiveness in a domestic context. In studies conducted in North America and Europe, researchers have demonstrated that the FFM has related to some important aspects of managerial effectiveness and job effectiveness. In a meta-analytic review of 117 criterion-related validity studies encompassing a sample of 23,994 subjects, Barrick and Mount (1991) reported that *conscientiousness* and *extraversion* were valid predictors of job proficiency for U.S. and Canadian managers. *Openness, neuroticism,* and *agreeableness* were not found to be valid predictors of effectiveness for managers in North America.

Salgado (1997) replicated this work through meta-analysis using a sample of 36 studies conducted in the European community. He also found that *conscientiousness* was a valid predictor of job proficiency for managers. Additionally, *neuroticism* was a valid predictor of job proficiency for managers in this European sample, and *extraversion* and *agreeableness* were related to managerial effectiveness when the work required major interpersonal contact.

In summary, *conscientiousness, extraversion, agreeableness,* and *neuroticism* have been found to be related to managerial effectiveness for managers in the United States, Canada, and Europe, with *conscientiousness* having the most consistent effect across the two meta-analytic studies.

Hypotheses

One of the arguments personality theorists make against the use of the Five-Factor Model is that it is *atheoretical*. In other words, it describes but does not explain. We developed our hypotheses relating a particular factor or facet of personality to managerial effectiveness by tying our reasoning to the construct of *psychological fit*: the fit between the preferences and predisposition of an individual and the demands of the work. It should be noted that this is not a reference to the literature on organizational culture and fit; rather, it focuses on the fit between an individual's disposition and the demands of that individual's work. In this regard it is closer to the career-development and career-choice literature (see, for example, Holland, 1985; Super, 1957). In other words, it builds on the idea that individuals seek out situations that match well with their personalities (Diener, Larsen, & Emmons, 1984; Emmons, Diener, & Larsen, 1986; Kristof, 1996).

If personality is a clustering of traits that predisposes individuals to behave in a certain way, then it is reasonable to suggest that people with a particular personality are more likely to be effective in a context where that behavior is considered to be appropriate, productive, and valued. This further suggests that there is a press within the context of managerial work that pulls for particular traits. Our thinking was also influenced by Murray's thesis (1938) regarding person-environment fit.

Along these lines, Andrews (1967) reported an interaction between the needs of managers and their organization's values regarding achievement and power. Pritchard and Karasick (1973) reported a connection between the need for order and highly structured work environments. Motowidlo and Van Scotter (1994) found that the relationship between personality and managerial effectiveness was stronger when effectiveness was separated into task and contextual dimensions, suggesting that there are overall contextual aspects of managerial work that are similar across organizations and jobs. By definition some aspects of managerial work differ in terms of the work's nature because jobs and functions within corporations can have unique aspects.

Holding with this line of thought, for each of the five factors in this report we state our hypotheses and describe how the relationship of a personality trait to the criterion measures might shift or remain the same as the work becomes more global in scope.

Conscientiousness. *Conscientiousness* has two themes: one of volition, the will to do well; and one of dependability, the predisposition to plan and be dependable. Ones and Viswesvaran (1997) have argued for a general theory of *conscientiousness* and managerial work and we concur. The dependable individual who desires to do well is more likely to be effective in the managerial role—regardless of the scope of the role—than the individual who is not so predisposed.

HYPOTHESIS 2.1: Regardless of how globally complex the context is in which the manager works, *conscientiousness* will be positively associated with the effectiveness criteria *knowledge and initiative* and *success orientation.*

Extraversion. *Extraversion*, as defined by the NEO PI-R, represents both sociability and dominance needs. It represents one's own personal needs to be with others and to be in charge when with others. *Extraversion* has been linked to managerial effectiveness when the job has a strong interpersonal component (Salgado, 1997). Because the population of interest in our study was collapsed across functions, the influence of function was masked. However, because the global manager works across cultures, often electronically or by telephone, we still expected the facets representing the sociable aspects of *extraversion* to be related to the leadership and interpersonal criteria as the manager's work becomes more globally complex.

HYPOTHESIS 2.2: *Extraversion* will be positively associated with the managerial effectiveness criteria *managing and leading* and *interpersonal relationships* when the work is more globally complex.

Openness. *Openness* to experience was found to be related to training proficiency but not managerial effectiveness in the previously cited North American and European studies. Because the global manager is working across cultures, we hypothesized that an individual who is imaginative, fascinated by the novel, and open to the ideas and values of others would be more effective in a global role. However, we did not expect *openness* to be directly related to the outcome criteria.

We based our hypothesis for *openness* on the theory that a higher degree of effectiveness in a managerial role results from having mastered a variety of challenging experiences. In this case, we suggested that personality is one factor that predisposes some individuals to engage in challenging and novel experiences, and that individuals who have successfully engaged in those experiences are prepared to be successful in particular managerial roles.

HYPOTHESIS 2.3: *Openness* will be positively associated with the role behavior *innovator.*

Agreeableness. The global manager role requires versatile interpersonal skill, an ability to demonstrate interest in and concern for others across geographical and cultural distances. Because global managers deal not just with one culture but with multiple cultures simultaneously, it seems almost impossible that they could remain aware of all of the nuances of cultural meaning and behavior. We suggest that individuals who are agreeable, as defined by the NEO PI-R, would be more effective because they would be more likely to be forgiven their cultural missteps.

Agreeableness has been found to be related to managerial effectiveness in European samples when the work has a strong interpersonal component (Salgado, 1997). We suggest that all global managerial work, by its nature, has a strong interpersonal component.

HYPOTHESIS 2.4: *Agreeableness* will be positively associated with the managerial
effectiveness indicators *managing and leading* and *interpersonal relationships*
when the managerial work is more globally complex.

HYPOTHESIS 2.5: *Agreeableness* will be positively associated with the role behavior
skills that are related to managing people: *leader* and *liaison*.

Neuroticism. Although Salgado (1997) found *neuroticism* to be related to effectiveness for managers working in the European community, Barrick and Mount (1991) did not obtain the same results for managers in the United States and Canada. Because of the stress and uncertainty associated with global managerial work, we expected *neuroticism* to be a particularly important trait in explaining effectiveness outcomes.

HYPOTHESIS 2.6: *Neuroticism* will be significantly and negatively correlated with all
of the effectiveness criteria when the managerial work is more globally complex.

Results and Discussion

Zero-order correlations were conducted between the five factors on the NEO PI-R, the five criterion measures, and predicted role behaviors for global and local managers. The results are presented in Tables 2.2 and 2.3.

Table 2.2

Personality Scale Correlations with Effectiveness Ratings for Managers in Low and High Global Contexts

Low global context n = 101	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Neuroticism	**–.22**	–.12	–.17	**–.23**	–.06
Extraversion	.19a	.006a	.06	.11	.10
Openness	–.06	–.11	.04	–.05	.11
Agreeableness	–.10	.007	–.11	–.12	–.05
Conscientious	.08	.03	.15a	.17a	–.03
High global context n = 80	**Managing and leading**	**Interpersonal relationships**	**Knowledge and initiative**	**Success orientation**	**Contextually adept**
Neuroticism	–.01a	.0003a	**–.23**a	–.07a	.008a
Extraversion	–.03	–.004	.09	.04	–.08
Openness	–.04	–.02	–.02	–.01	–.02
Agreeableness	.10a	.18a	.02	.002	–.06
Conscientious	.12	–.001	**.34**a	**.30**a	.06

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Table 2.2 presents the results correlating managers' personality scale ratings with bosses' effectiveness ratings. Hypothesis 2.1 was supported for managers who work in a high global context but not managers who work in a low global context. Hypotheses 2.2 and 2.4 were not supported. Hypothesis 2.6 was partially supported from the boss perspective, but *neuroticism* was also related to effectiveness criteria for local managers. In retrospect this was not surprising, as emotional stability and *conscientiousness* were found to be general competencies related to effectiveness across jobs (Barrick, 2000).

Many of our hypotheses were not supported. We had reasoned that although global and domestic managerial work are similar in their organizational and bureaucratic demands, they are different in their demands for interpersonal skill, openness to new experiences, and the ability to cope with stress and uncertainty. Because of this reasoning, we predicted that *conscientiousness* will behave in a similar fashion whether the managerial work is global or domestic in scope, but that *agreeableness*, *openness*, *neuroticism,* and *extraversion* will be more strongly related to the criterion measures for managers in global jobs than for managers in domestic jobs. We also believed that all five of the factors shared significant variance with other variables in the model that in turn would be more critical in explaining global managerial effectiveness than in explaining domestic managerial effectiveness.

Instead, *neuroticism*, not *conscientiousness*, was related to criterion ratings for managers in high- and low-global-complexity jobs. *Conscientiousness* was only related to criterion ratings for managers in the high-global-complexity condition.

The correlations of personality traits with role skills are presented in Table 2.3. Hypothesis 2.3 was supported. *Openness* is positively associated with the role behavior *innovator*. Hypothesis 2.5 was partially supported. *Agreeableness* was positively associated with skill in the role of *leader* but not *liaison*.

Table 2.3
Personality Scale Correlations with Roles for Managers in Low and High Global Contexts

Low global context n = 101	Monitor	Spokes-person	Leader	Liaison	Decision maker	Negotiator	Innovator
Neuroticism	–.19	**–.22**	–.11	–.07	**–.23**	–.07	–.11

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

CHAPTER 3
Managerial Capabilities—Learning and Effectiveness as a Global Manager

In our conceptual model we explored learning and effectiveness in global roles from several perspectives. These included the direct relationship of experiential learning to managerial effectiveness in the global role, specifically past experience managing diverse workgroups in one's own country (cultural heterogeneity) and experience with other cultures through early language training and by living in more than one country as a child and adolescent (cosmopolitanism). (These topics are addressed in Chapters 4 and 5.) In this chapter we explore the relationship of three specific learning behaviors to managerial effectiveness in jobs of high and low global complexity (see Figure 4).

Figure 4
**A Conceptual Model of Predictors of Managerial Effectiveness in a Global Context
(Managerial Capabilities)**
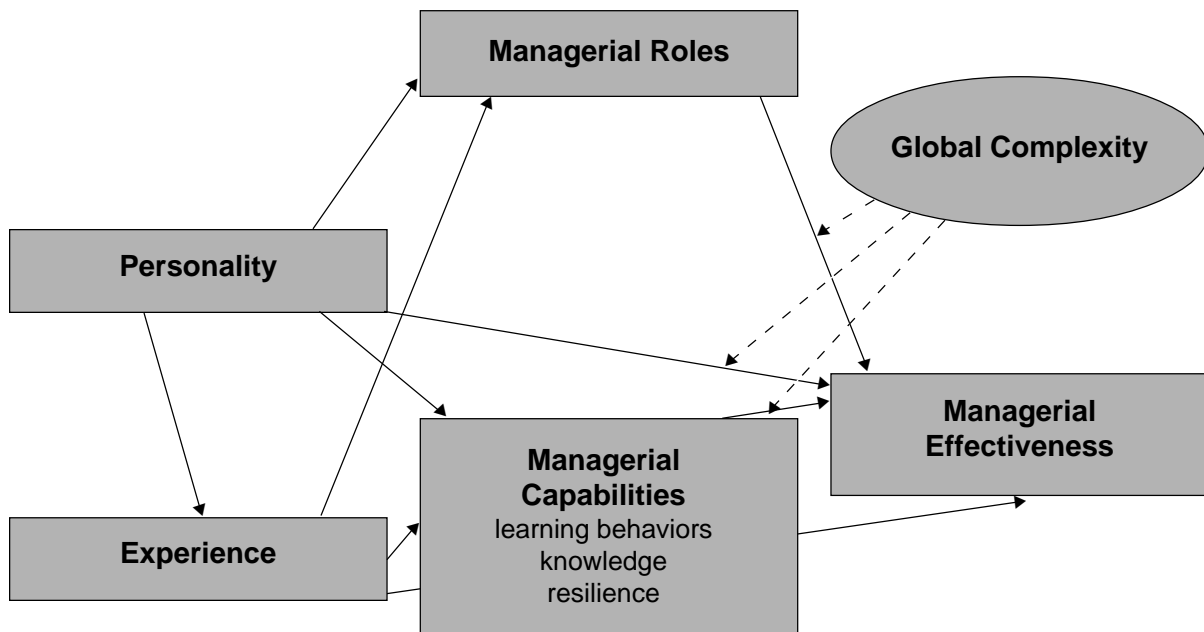

Background

In the United States over the past two decades, scholars have used the ability to learn from workplace experiences as a major construct to explain career success (attaining a senior-level organizational position) and managerial effectiveness. Researchers have argued that the opportunity and willingness to engage in a variety of work-based experiences and the ability and willingness to learn and adapt as a result are key factors in explaining managerial development and subsequent effectiveness (Keys & Wolfe, 1988; McCall, Lombardo, & Morrison, 1988; McCauley, 1986; Morrison & Hock, 1986; Nicolson & West, 1988; Spreitzer, McCall, & Mahoney, 1997).

More recently, taxonomies of global leadership skills and capacities have suggested that learning is a key to success in the global role. For example, Kanter (1995) has described an individual able to "learn from and leverage the heterogeneity and chaos of the worldwide market place." Gregersen, Morrison, and Black (1998) have listed the characteristic of inquisitiveness as an essential trait of the effective international manager. Spreitzer, McCall, and Mahoney (1997) have identified those who search for opportunities to learn, seek and use feedback, remain open to criticism, and are flexible and cross-culturally adventurous as more likely to be effective in an international executive role.

Hypotheses

Learning behaviors. The learning capabilities that we adopted for use in our model were *self-development*, *perspective taking*, and *cultural adaptability*. In introducing learning capabilities and skills into the model we wanted to understand if the learning behaviors associated with experiential or action learning would interact with global complexity to predict managerial effectiveness. To the extent that they did, we wanted to explore how people develop these learning skills. Were learning skills related to personality traits such as emotional stability (neuroticism) and openness to experience? Was the ability to learn related to personality, or did adult experiences of cultural heterogeneity and early life experiences with diverse cultures better account for such an ability? Could managers acquire these learning behaviors?

To the extent that learning skills proved to be associated with effectiveness in the global role, and to the extent that learning skills could be understood as trait based or experience based, we cast the process of developing individuals for global managerial responsibilities as either a selection issue, a development issue, or both.

Self-development. Self-development describes a set of behaviors people would exhibit were they to take responsibility for their own development. It is meant to exemplify a person who adopts an active rather than passive stance in regard to his or her own development. Behaviors that typify this kind of learning orientation include a demonstrated awareness of one's own strengths and weaknesses, openness to feedback about one's actions, and eagerness to engage in new experiences.

In the U.S. practitioner-oriented literature (for example, Dalton & Hollenbeck, 1996; McCall, Lombardo, & Morrison, 1988), scholars have considered self-awareness and personal development key competencies for managerial effectiveness. Individuals who possess these competencies are presumed to have developed into better managers and leaders because these self-development behaviors have allowed them to become more skilled (Tesluk & Jacobs, 1998).

Little empirical research exists to back up these presumptions and suppositions. Instead, the beliefs about the importance of self-development rely on a value set taken from the traditions of the psychotherapy literature—self-awareness as the first step in a behavior-change process (Freud, 1960)—and the goal setting and knowledge-of-results literature (for example, Locke & Latham, 1984). An American and European literary and philosophical tradition that holds self-knowledge as a valued human trait also plays a part.

On their measure of learning agility, Lombardo and Eichinger (1994) demonstrated a partial conceptual overlap with the *self-development* construct we have presented in our model. Dalton and Swigert (1999) reported modest relationships between the learning versatility construct and the learning behaviors necessary to engage in workplace learning, but found no significant relationship between boss and peer ratings of potential effectiveness and self-reported ratings of learning versatility.

Spreitzer, McCall, and Mahoney (1997) investigated the relationship of learning skills to international effectiveness. They constructed six scales to measure the ability to learn from experience: (1) seeks opportunities to learn, (2) seeks feedback, (3) uses feedback, (4) is open to

criticism, (5) is flexible, and (6) is cross-culturally adventurous. The first four of these scales overlap with the content of our *self-development* construct. Spreitzer et al. reported the relationship between a boss's rating of his or her direct reports on these scales and the boss's rating of the likelihood that these same direct reports would be successful in an international assignment. In our study, two of the scales that we included in the *self-development* construct, *seeks opportunities to learn* and *is open to criticism*, were modestly related to boss ratings of success on international assignments. However, the independent and dependent variables in this research were both rated by the boss, so same-source bias clouds our interpretation of the results.

On the Benchmarks® developmental instrument (Lombardo & McCauley, 1988), the scale *self-awareness* includes items about a person's willingness to seek and attend to feedback from others. This measure demonstrated a significant relationship to boss ratings of promotability and to longitudinal measures of organizational progress but not to independent assessments of promotability or effectiveness evaluations.

We were unaware of any other studies that have tested the relationship of self-development skills to managerial effectiveness, particularly for managers with international responsibilities.

> HYPOTHESIS 3.1: *Self-development* will share significant variance with all effectiveness criteria for managers in the low-global-context group.

This hypothesis was tentative. It may hold only to the extent that the manager was working in a culture where active attention to one's self and one's career growth is considered appropriate. (Our data did not allow us to entertain this perspective.) For example, some cultures (Japanese or Middle Eastern, for example) consider seeking feedback poor form. Managers in these cultures wait to receive assignments and do not seek them out (Dalton, 1998). Some cultures can view self-development strategies as inappropriate because they represent undue attention to the individual. This is characteristic of cultures in which the self is considered an interdependent rather than an independent construct (Cross, 1995). Schwartz's concept of work centrality suggested that in some cultures one's work experience is secondary to the totality of one's life experience (1999). An undue focus on attaining skills to advance one's career might in such cultures run counter to norms and expectations.

Nonetheless, it is important to address the relationship of self-development to managerial effectiveness because much of executive development in the United States is based on the notion of self-development. This kind of assumption causes problems when U.S.-based leadership-development professionals try to introduce these concepts to international organizations.

Perspective taking. The set of skills and behaviors defined as *perspective taking* describe a person who is able to listen well; is able to consider multiple points of view, multiple possible solutions, and multiple perspectives; and is able to entertain empathy toward another person's point of view. Perspective taking can perhaps be seen as what Gardner (1983) has called one of the "personal intelligences."

Gardner (1983) wrote of six basic intelligences: (1) linguistic, (2) musical, (3) logical-mathematical, (4) spatial, (5) bodily-kinesthetic, and (6) personal. The area of personal intelligence includes self-knowledge (intrapersonal) and knowledge of other people (interpersonal). He considered these personal intelligences as different from the other five. In his view, intrapersonal intelligence represents access to one's own emotional life. Interpersonal intelligence is the ability to notice and make distinctions among other individuals, particularly among their moods, temperaments, motivations, and intentions. Unlike the other intelligences, however, "the varieties of personal intelligence prove much more distinctive, less comparable, perhaps even unknowable to someone from an alien society. . . . (T)he 'natural course' of the personal intelligence is more attenuated than that of other forms, inasmuch as the particular symbolic and interpretive systems of each culture soon come to impose a decisive coloring on these latter forms of information processing" (p. 240).

Gardner's view affected our work in that when we discuss perspective taking (and further, when later in this report we discuss cultural adaptability) we are dealing with the highest manifestation of these intrapersonal and interpersonal intelligences. Ideally an effective global manager can rise above his or her own cultural understanding of self and others, translating his or her intrapersonal and interpersonal intelligence capacity into the symbol system of another culture. Perspective taking is the ability to transform one's meaning structures; in other words, individuals make sense of what they know within a network of values, beliefs, attitudes, and past experiences, interpreting what happens to them through this cultural framework. When they (managers, in this case) work with individuals from other cultures, they encounter people who behave in ways that are incongruent with their own expectations of behavior. If managers interpret and label what others are doing through their own interpersonal framework, they may make incorrect assumptions about others' motivations and respond incorrectly. If managers are able to take the perspective of others, they can transform their understanding, alleviating the anxiety brought about by encountering and dealing with people who have different value systems.

We knew of no empirical work that related the ability to take the perspective of another to international managerial effectiveness. In his counseling work with college students, Perry (1981) described a developmental progression of movement from dualism to contextual relativism—the ability to make judgments in a relative context while holding one's own values constant. In the sojourner literature summarized by Kealy (1989), many researchers were reported to have agreed that empathy, interest in the local culture, flexibility, tolerance, and technical skill predict success (defined as adjustment) in another culture. Our construct *perspective taking* may capture the concepts of empathy, flexibility, and tolerance.

At the theoretical level, Mezirow (1991) wrote of learning through perspective transformation. "We encounter experiences, often in an emotionally charged situation, that fail to fit our expectations and consequently lack meaning for us, or we encounter an anomaly that cannot be given coherence either by learning within existing schemes or by learning new schemes. Illumination comes only through redefinition of the problem. . . . We redefine old ways of understanding" (p. 94).

Given our understanding of perspective taking and managerial work in high-global-complexity conditions, we designed the following hypotheses:

HYPOTHESIS 3.2: *Perspective taking* will share significant variance with the effectiveness criteria *managing and leading, interpersonal relationships, success orientation,* and *contextually adept* when the manager's work is more globally complex.

HYPOTHESIS 3.3: *Perspective taking* will be positively associated with the personality scale *openness*.

HYPOTHESIS 3.4: *Perspective taking* will be negatively associated with the personality trait *neuroticism*.

Cultural adaptability. *Cultural adaptability* is defined as a set of behaviors used by a person motivated to understand the influence of culture on behavior and who has the skills to learn about and use cultural differences. More than the capacity to understand a particular culture, it describes a person who is able to work well across multiple cultures. Cultural adaptability may be a special case of perspective taking. Cultural adaptability may also encompass the cultural empathy construct identified by Ruben (1976) and Cui and Van Den Berg (1991).

The construct of cultural adaptability is an old one, grounded in the training literature of institutions such as the Peace Corps, religious missionary communities, the diplomatic corps, the military, and the business community. Each of these groups has struggled to prepare people to work effectively in other cultures (see, for example, Hannigan, 1990). What differentiates these various constructs and definitions is the role the sojourner plays and the results the group seeks. For example, the struggle for the Peace Corps volunteer is to relocate and to adjust to living in another culture, assuming the role of teacher and helper. The role of the international diplomat is to relocate and to adjust to living and working in another culture in order to represent the interests of the diplomat's country at a high level of political sensitivity and potential visibility. The role of the military spouse may be to relocate and to adjust to living in an enclave of fellow expatriates.

The role of the global manager is different from these roles in that the global manager often does not relocate and so does not face the adjustment so often described in the literature. Rather, the global manager manages as a traveler and/or from a distance and is responsible for activities in multiple countries simultaneously, countries that do not share a common culture. Therefore, we are uncertain that the literature on cultural adjustment will help us understand the skill of cultural adaptability as we define it: the need to know how to adapt quickly in multiple and ever-changing cultural contexts in which interactions are sometimes face-to-face and sometimes at a distance.

Additionally, much of the existing literature has spoken to the criterion measure of cross-cultural adjustment rather than to the criterion measure of work effectiveness. We are interested in the criterion measure of work effectiveness as seen through the eyes of the target manager's boss.

Studies conducted by McCall, Spreitzer, and Mahoney (1994) and Spreitzer, McCall, and Mahoney (1997) have helped us develop our hypothesis related to leadership effectiveness. Their taxonomy of competencies and learning skills, hypothesized to predict success as an international manager, included a learning skill operationalized as *adapts to cultural differences*. They presented this five-item scale in a subsequent factor analysis of the data as two scales: *sensitive to cultural differences* and *is culturally adventurous*. Boss ratings of an individual's potential to be successful as an international manager and as an expatriate were found to be significantly correlated with boss ratings of an individual's perceived skill on these two items. (In this research the outcome criteria were related to work effectiveness and not adjustment.) Using this scale as the basis for our own construct of cultural adaptability, we formed the following hypothesis:

> HYPOTHESIS 3.5: *Cultural adaptability* will share significant variance with the effectiveness criteria *managing and leading*, *interpersonal relationships*, *knowledge and initiative*, *success orientation*, and *contextually adept* when the work is more global in scope.

Several other studies provide the context for our additional hypotheses. For example, Oberg (1960), a pioneer in studying cross-cultural adjustment, coined the term *culture shock*. People constantly monitor, interpret, and explain the behavior of themselves and others as part of interacting with one another. When dealing with people from other cultures, the behaviors are the same—but the meaning attributed to the behaviors differs. Culture shock represents the anxiety resulting from trying to process and understand how the world works when cultural significance is unmoored.

As Adler stated, "Culture shock is a form of anxiety which results from the misunderstanding of commonly perceived and understood signs of cultural interaction" (1975, p. 13). Adler treated culture shock as a developmental opportunity, an experience that allows a person to first understand the relativity of his or her own value set and then to investigate, reintegrate, and reaffirm a relationship to others.

Anderson (1994) divided the cultural-adaptation literature into four major models: (1) the recuperation model, (2) the learning model, (3) the journey model, and (4) the homeostatic model. She suggested that it is a mistake to consider cultural adaptation as different from many other transitional processes, arguing that cultural adaptation is simply an accommodation to change. Using Anderson's conceptualization of multiple models of cultural adaptability, we would place our view in the camp of the homeostatic model (Grove & Torbiorn, 1985; Torbiorn, 1982), which holds that cultural adaptation requires a change in one's perceptual frame and behavior in order to adapt to the ambient environment.

Cui and Awa's (1992) construct of intercultural effectiveness encompasses language ability, interpersonal skills, empathy, social interaction, managerial ability, and personality traits. This is similar to our conceptual model, which incorporates life experiences, personality traits, role

skills, and capacities as predictors of perceived managerial effectiveness. We note, however, that Cui and Awa's interest in this work was the sojourner expatriate, not the global manager.

Because the global manager is constantly being exposed to cultural differences, sequentially and in parallel, we argue that the ability to manage culture shock will affect the manager's effectiveness:

> HYPOTHESIS 3.6: *Cultural adaptability* will be grounded in one's ability to manage the anxiety associated with the dissonant messages of the foreign workplace and thus will be highly correlated with emotional stability *(neuroticism).*

Finally, we wanted to address the skill of cultural adaptability itself. If this is a skill highly related to effectiveness as a global manager, then who is most likely to have this skill or to be able to acquire it? How do people acquire cultural adaptability? To answer that question we believed it was important to go beyond the "how" to the "why." Why might individuals who are willing to entertain novel ideas and unconventional values be better prepared and more motivated to deal with another kind of difference? The psychological theory of mere exposure might partially explain this phenomenon. This theory has argued that if individuals have repeated exposure to a stimulus, they will develop an increase in positive affect toward that stimulus (Zajonc, 1968). In 1989 Bornstein explained it further: It is advantageous to human beings to prefer the familiar over the novel. The familiar is safe and unpredictable; the unfamiliar is unsafe and unfamiliar. Bornstein argued that there is an evolutionary reason for this and suggested that it is an adaptive human trait. If this is the case, then individuals exposed to cultural differences early in life or career will have a broader sense of what constitutes the familiar than will individuals who have not been so exposed. They will not experience the cultural "other" as unfamiliar, they will experience less anxiety around what presents itself as different, and they will seek out more international experiences.

In contrast to the mere exposure theory's behavioral explanation for the skill of cultural adaptability, we wished to address the personality trait *openness* and its posited relationship to cultural adaptability. This trait, as measured by the NEO PI-R, is made up of six facet scales: aesthetics, fantasy, values, feelings, ideas, and actions. Of all the traits measured by the FFM, this construct has proven the most problematic for researchers. Some authors have equated it to intelligence and divergent thinking, others to creativity (Costa & McCrae, 1992). In the workplace-effectiveness literature, *openness* has been most often related to effectiveness in training programs, not to job-effectiveness criteria. In our work we hypothesized as follows:

> HYPOTHESIS 3.7: *Openness* will be positively associated with the learning scale *cultural adaptability*.

Knowledge. A large body of literature already exists that demonstrates the relationship of job knowledge to managerial effectiveness (see, for example, Kotter, 1982). For that reason we

did not devote a chapter of this report to a review and explanation of this variable in our model. Still, we believed it essential to include *business knowledge* and *international business knowledge* in our model. Knowledge seemed to fit best in a chapter that discussed learning. We made the following propositions regarding the relationship of *business knowledge* and *international business knowledge* to effectiveness in managerial jobs of high and low global complexity:

> HYPOTHESIS 3.8: *Business knowledge* will share significant variance with the effectiveness criteria *knowledge and initiative* and *success orientation* regardless of the global complexity of the job.

> HYPOTHESIS 3.9: *International business knowledge* will share significant variance with the effectiveness criteria *knowledge and initiative* and *success orientation* when the manager's work is more globally complex.

> HYPOTHESIS 3.10: The capability *insightful* will share significant variance with the effectiveness criteria *knowledge and initiative* and *success orientation* regardless of the global complexity of the job.

> HYPOTHESIS 3.11: *Conscientiousness* will be related to bosses' ratings of *business knowledge* and *international business knowledge.*

> HYPOTHESIS 3.12: *Business knowledge* and *international business knowledge* will be positively associated with *conscientiousness*.

Resilience. There was also a substantial body of literature relating the construct of resilience to job satisfaction and job effectiveness (for example, Maddi & Kobassa, 1984). The constructs representing resilience and integrity in our model were placed in this chapter to connect the idea that those individuals most likely to demonstrate learning behaviors will be those who are able to cope with the uncertainties and ambiguities associated with learning. We made the following propositions regarding the relationship of integrity and coping with stress to effectiveness in managerial jobs of high and low global complexity.

> HYPOTHESIS 3.13: The ability to cope with stress will share significant variance with all effectiveness criteria when the manager's work is more globally complex.

> HYPOTHESIS 3.14: *Integrity* will share significant variance with *managing and leading* and *interpersonal relationships* regardless of global complexity.

We further hypothesized two relationships between managers' resilience capabilities and their personality traits.

HYPOTHESIS 3.15: The skill of *coping* will be negatively associated with the trait *neuroticism*.

HYPOTHESIS 3.16: *Time management* will be positively associated with *conscientiousness*.

Capabilities importance. Finally, we hypothesized about the degree of importance global managers would place on different capabilities within the scope of high global complexity.

HYPOTHESIS 3.17: Managers in contexts of high global complexity will attribute more importance to the capabilities of *cultural adaptability* and *perspective taking* than will managers in contexts of low global complexity, but managers in either context will perceive the capability of *self-development* equally.

HYPOTHESIS 3.18: Managers in contexts of high global complexity will attribute more importance to the capability of *international business knowledge* than will managers in contexts of low global complexity, but managers in either context will perceive the capability of *business knowledge* equally.

HYPOTHESIS 3.19: Managers in contexts of high global complexity will attribute more importance to the capabilities of *time management* and *coping* than will managers in contexts of low global complexity, but managers in either context will perceive the capability of *integrity* equally.

Results and Discussion

Learning. Zero-order correlations were conducted between the three learning scales and the five effectiveness criteria as rated by their bosses and self-reported personality scales for local and global managers (see Tables 3.1 and 3.2). Hypothesis 3.5 was supported. Hypothesis 3.1 was not supported. There was partial support for Hypothesis 3.2. Only the learning scale *perspective taking* was significantly related to criterion measures and only in the high-global-complexity condition.

Table 3.1

Learning Behavior Scale Correlations with Effectiveness Ratings for Managers in Low and High Global Contexts

Low global context $n = 101$	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Cultural adaptability	.11	.11	.11	.14	.19
Self-development	.14a	.05a	.19a	.19a	.18a
Perspective taking	.06	.05	.04	.11	.17
High global context $n = 80$	**Managing and leading**	**Interpersonal relationships**	**Knowledge and initiative**	**Success orientation**	**Contextually adept**
Cultural adaptability	.15a	–.08a	**.26**a	.14a	.15a
Self-development	–.09	.04	.04	.05	–.03
Perspective taking	.14a	.18a	**.22**a	.16a	**.21**a

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Table 3.2

Learning Behavior Scale Correlations with Personality Scales for Managers in Low and High Global Contexts

Low global context $n = 101$	Neuroticism	Extraversion	Openness	Agreeableness	Conscientious
Cultural adaptability	–.09	.09	.05a	–.03	.17
Perspective taking	.00a	.03	.07a	**.20**	.15
High global context $n = 80$	**Neuroticism**	**Extraversion**	**Openness**	**Agreeableness**	**Conscientious**
Cultural adaptability	**–.22**a	.02	–.11a	.15	**.28**
Perspective taking	.11a	.11	.18a	**.32**	.17

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Hypotheses relating the learning behavior scale *perspective taking* to the personality trait *neuroticism* were not supported, but as predicted there was a significant and positive relationship between *agreeableness* and *perspective taking*. The capability *cultural adaptability* was related to *neuroticism* as predicted in Hypothesis 3.6, but was not related to *openness* as was hypothesized in 3.7. These results suggest that managers adept at perspective taking are more likely to have the traits of emotional stability and agreeableness—which includes trust in and consideration for others, candor, and sympathy.

Knowledge. Zero-order correlations were conducted between the three knowledge scales, the five effectiveness criteria, and personality. The results can be seen in Tables 3.3 and 3.4. Hypothesis 3.8 was supported only for the global condition. Hypothesis 3.9 was supported. Hypothesis 3.10 was supported only for the local condition. *Business knowledge* and *international business knowledge* are significantly related to the criteria in the high-global-complexity condition but not the low-global-complexity condition.

The hypothesized relationship between *business knowledge*, *international business knowledge,* and *conscientiousness* was partially supported for managers working in a low global context and fully supported for managers working in a high global context. *Conscientiousness* for managers in the high global context was related to the skills *business knowledge* and *international business knowledge*.

Table 3.3

**Knowledge Scale Correlations with Effectiveness Ratings for Managers
in Low and High Global Contexts**

Low global context *n* = 101	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Business knowledge	.07	.03	.14a	.17a	.06
International business knowledge	.07	.14	.13	.11	.14
Insightful	.07	.001	.19a	**.24**a	.12
High global context *n* = 80	**Managing and leading**	**Interpersonal relationships**	**Knowledge and initiative**	**Success orientation**	**Contextually adept**

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Resilience. The zero-order correlations presented in Table 3.5 address Hypotheses 3.13 and 3.14. They reflect the association between the resilience scales, the five effectiveness criteria as rated by bosses, and personality scales for domestic and global managers. Hypothesis 3.13 was partially supported. Resilience was only associated with bosses' ratings of *knowledge and initiative* and *success orientation*. Hypothesis 3.14 was not supported. The scale *coping* is related to boss-criterion ratings in both the low- and high-global-complexity condition. *Time management*, although identified by managers in the high global context as important to their jobs, was not significantly related to any of the effectiveness criteria.

Table 3.5

High global context *n* = 80	**Managing and leading**	**Interpersonal relationships**	**Knowledge and initiative**	**Success orientation**	**Contextually adept**
Coping	.08a	.05a	**.36**a	**.26**a	.16a
Integrity	−.05a	.10a	.09	.03	−.02

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

As shown in Table 3.6, Hypothesis 3.15 was supported. Hypothesis 3.16 was not supported.

Table 3.6

**Resilience Scale Correlations with Personality Scales for Managers
in Low and High Global Contexts**

Low global context *n* = 101	**Neuroticism**	**Extraversion**	**Openness**	**Agreeableness**	**Conscientious**
Coping	**−.34**a	**.23**	.03	.01	.18
High global context *n* = 80	**Neuroticism**	**Extraversion**	**Openness**	**Agreeableness**	**Conscientious**
Coping	**−.50**a	**.22**	.15	.16	.17

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Capabilities importance. Both independent sample *t*-tests and nonparametric Mann–Whitney *U* analyses were conducted to test for mean differences reported by low- and high-global-complexity managers on the level of importance attributed to the eight capabilities. The results are presented in Table 3.7. Hypothesis 3.17 was partially supported; differences were found for *cultural adaptability* but not *perspective taking*. Hypothesis 3.18 was supported. Hypothesis 3.19 was partially supported as differences were found for *time management* but not *coping*. Managers in high-global-complexity jobs were statistically more likely to endorse the

capabilities of *cultural adaptability, international business knowledge,* and *time management* as extremely important to their current job.

The two groups did not differ in the importance they ascribed to the remaining capabilities *(self-development*, *perspective taking*, *business knowledge*, *insight*, *coping*, and *integrity).*

Table 3.7

Capabilities Importance Ratings for High- and Low-Global-Complexity Jobs

Managerial capabilities	
Cultural adaptability	$T = -8.27$ $p < .001$ low $= -.48$, high $= .50$

Perspective taking	NS
Business knowledge	NS
International business knowledge	$T = -7.69$ $p < .001$ low $= -.46$, high $= .46$
Time management	$T = -2.05$ $p < .05$ low $= -.13$, high $= .14$
Coping	NS
Integrity	NS

CHAPTER 4

Experience—Cosmopolitanism and Managerial Effectiveness in a Global Context

In this chapter we turn our focus toward one group of people who we believe have the skills needed to succeed in leadership positions of high global complexity. "Even in this day and age and even with Fortune 500 companies, it is difficult to convince recruiting departments and managers of the benefit of hiring a student with multicultural sensitivity, who is bilingual, who has international exposure and a real knowledge of international business over a person with a (traditional) MBA" (Feldman & Tompson, 1992, p. 345). Such people might be called *cosmopolitans*. In the following pages we define cosmopolitans, discuss what the literature says about them, and hypothesize about the relationships between cosmopolitanism and other elements of our model.

Background

Our theoretical description of cosmopolitanism is based on interviews, personal experience, observation, and some data. We intend it to serve as a preliminary description, not as a factual case.

A *cosmopolitan* is not characterized by a particular personality profile, a particular IQ, a specific type of profession, or a specific background. There is no singular life experience that makes one person a cosmopolitan and another person not. The difference is that cosmopolitans have spent large portions of their lives oriented and focused externally to themselves and to their

Figure 5
A Conceptual Model of Predictors of Managerial Effectiveness in a Global Context (Experience)
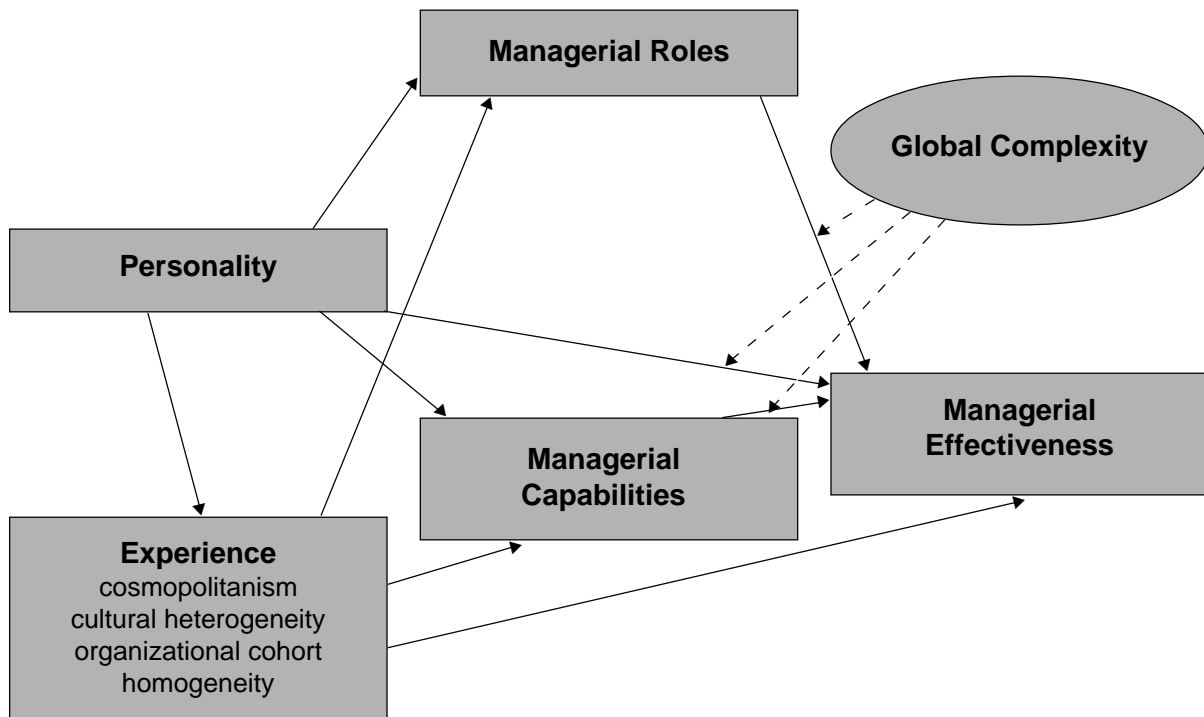

home culture. An interest and attention toward other cultures is a common thread among cosmopolitans.

Cosmopolitanism has been previously referred to in the literature, but the definition of the variable is much different from our conceptualization. Early in the last century Gale (1919) discussed the necessity of travel and education in creating a cosmopolitan citizen but did not relate those experiences to what one might learn through interaction with foreign cultures. The term *cosmopolitan* has also been used to describe media usage (McNelly, Rush, & Bishop, 1968), an attitude more accepting of integration (Caditz, 1976), and loyalty to the profession rather than to the employing organization (DeVries, 1971; Goldberg, 1976; Kirschenbaum & Goldberg, 1976; Rotondi, 1977).

For the purposes of our research, we viewed cosmopolitanism as describing an individual difference that Kanter defined as "a mindset that finds commonalties across places" (1995, p. 61). Cosmopolitans live in the context of their nation and the world rather than in the context of their local community (Hannerz, 1990; Ratiu, 1983). They not only understand that cultures and places differ, but they are also able to integrate themselves into different cultures in such a way that neither offends the other nor subverts the cosmopolitan's own cultural orientations.

Because of their orientation toward others, cosmopolitans can develop skills that help them interact effectively with others different from themselves. They welcome other perspectives. Although they may prefer their own way of doing things, they are not parochial and do not ascribe to the "not invented here" philosophy. They will think about ideas that seem against their own cultural grain. Cosmopolitans are political in that they are aware of the impact of their behavior on others (personally and professionally); however, others may not perceive them as political in that their ability to see a variety of perspectives and integrate culturally different ideas give them the aura of mavericks within an organization.

Although there is no direct literature on cosmopolitanism as we have described it here, Ratiu (1983) investigated how international executives learned, examining a group of people very similar to our definition. He found that the "internationals" learned differently from those who were not described as internationals. The critical difference in learning styles was that internationals used stereotypes provisionally, dealt with the stress of interacting with different others by acknowledging it, and tended to be empirical in their understanding of other cultures in that they questioned rather than ascribed motivations. Other managers tended to believe that stereotypes were fairly enduring, did not acknowledge stress, and leaned toward ascribing motivations to behaviors. Ratiu did not investigate how these so-called internationals had acquired their skills. He stated that many of them had childhood experiences that had facilitated the development of these skills, but he did not explicitly identify which experiences were critical to developing them.

Although they did not talk directly about internationals, Kets de Vries and Mead (1992) described what they thought was critical in the development of the global manager. They discussed in detail what types of experiences good global managers would need to have and wrote about the specific types of experiences they expected them as having had in developing such skills. They proposed that in addition to standard technical competence and business experience, global managers would need to be able to interact effectively with people who were different. One way this skill could be learned, they suggested, was through a number of professional development factors including cultural diversity in family, early international experience, bilingualism, self-confidence, hardiness, envisioning, study in another culture, and study in an international environment.

Kets de Vries and Mead went on to say that early socialization into cross-cultural environments might be an important factor in the ability to work cross-culturally as an adult. They wrote: "Given the impact of childhood socialization on adult development, it is to be expected that early exposure is a determining factor in how successful the individual will be in dealing with cultural adaptability later in life" (1992, p. 193). Further, they wrote that "the strongest influences on both leadership qualities and the ability to adapt culturally stem from childhood background and psychological development. . . . Following our framework, it can be said that in the development of a global leader ideally it helps to have a childhood background characterized by cultural diversity, one aspect being early international experience" (p. 200).

In 1999 Kets de Vries and Florent-Treacy wrote a book that examined the lives of Richard Branson, Percy Barnevik, and David Simon, three successful global leaders. While examining the

technical competence and business savvy of these leaders, the authors also discussed their life experiences and their ability to work with others. What the authors found was that all three had spent time in their youths in situations that arguably would have increased their competence in interacting effectively with people possessing very different perspectives, especially a culturally different perspective. These three leaders worked across differences as part of their early life experiences and had developed a hardiness that helped them withstand the effort working across differences demanded.

In addition to skills developed from specific life events, the literature has suggested a variety of attributes relevant to the development of a cosmopolitan. From a developmental perspective, being able to take another's perspective and "empathic accuracy" are critical to the ability to deal with different others (Davis & Kraus, 1997). Relational, cross-cultural, and inter-personal abilities are important to success in international environments (Pucik & Saba, 1998), as are cognitive complexity, emotional energy, and psychological maturity (Wills & Barham, 1994).

Cosmopolitans, then, can be viewed as developing through experience and the practice of specific skills. The development of these skills can begin in childhood or adulthood. A childhood beginning allows more time for practicing those skills. It is possible that individuals can develop cosmopolitan skills outside of work as an adult through cultural exposure (marrying into a culturally different family, for example, or through friendships) and interest (travel, for example, or formal educational opportunities such as foreign language study).

Cosmopolitans are not cultural chameleons. They can't speak every language, do not know every point of etiquette in every culture, can't tell you how to tip in every town, and do not know how to get a cab on the street in every place they visit. Although to others their cultural flexibility and adaptability may appear effortless, their balancing of varied cultural perspectives and their empathy for others different from themselves exerts a high price and is more difficult than interacting with people from what they would call their own culture. A cosmopolitan's skill and orientation toward cultural adaptability is an interpersonal skill that helps them interact with others different from themselves, but it is worth noting that such a skill does not make such an individual better at the technical aspects of leadership.

Hypotheses

As local economies become increasingly globally oriented, more and more managerial positions require that people work or interact with others from different cultures (Aycan, 1997; Tung, 1997, 1998). These globally oriented positions differ widely in their complexity. Some require people to manage or interact with others across multiple time zones and who speak a variety of languages. Other positions require people to live and work in foreign environments for short assignments or for longer periods of time. Technical improvements in communication and travel have made it increasingly easy for companies to assemble teams of people who reside and work in different places, who speak different languages, and who carry with them different values and belief systems.

It has been suggested that people who are able to do work across cultures or internationally are more likely to be successful in a global economy (Bennett, 1989). We believe that those

people we call cosmopolitans have the orientations and skills arising from life experiences that help them interact effectively with others different from themselves and, therefore, to be more successful global leaders.

To this end we operationalized cosmopolitanism as "early life" and "adult life" experience. Early life experience includes the number of languages spoken before age 13 and the number of countries in which the individual was educated. Experience gained later in life includes the number of countries in which the individual has lived, the number of languages spoken, and expatriate experience.

> HYPOTHESIS 4.1: *Cosmopolitanism* will be positively correlated with bosses' ratings of effectiveness.

> HYPOTHESIS 4.2: Individuals who spoke/speak more languages in early life and adult life, who have lived in more countries, and who were educated in more countries will have higher scores on *knowledge and initiative, success orientation,* and *contextually adept* than individuals who have not had these experiences, regardless of the global complexity of their current jobs.

Given our description of cosmopolitanism and the list of factors that may contribute to the development of cosmopolitanism, how does cosmopolitanism relate to the variables we are examining in our model of managerial effectiveness? We anticipated a few specific relationships. It follows that the predisposition to be fascinated by the values and customs of others *(openness)* should be related to cosmopolitanism.

> HYPOTHESIS 4.3: *Cosmopolitanism* will be positively related to the personality trait *openness*.

> HYPOTHESIS 4.4: Managers who speak multiple languages and who have lived in multiple countries will have higher scores on the personality trait *openness*.

We also proposed a link between *experience* and *capabilities.* (For specifics on the capabilities and effectiveness turn to Chapter 3.)

> HYPOTHESIS 4.5: *Cosmopolitanism* will be positively related to self-ratings of the capabilities of *perspective taking*, *cultural adaptability*, and *international business knowledge*.

> HYPOTHESIS 4.6: *Number of languages spoken before the age of 13* and *number of countries educated in* will each be positively associated with the capabilities of *perspective taking*, *cultural adaptability*, and *international business knowledge*.

HYPOTHESIS 4.7: Experience as an expatriate will be positively related to *international business knowledge* and *cultural adaptability*.

Results and Discussion

For purposes of this report, *cosmopolitanism* was operationalized in two ways. Both approaches took into account early and later life experience. They differed, however, in the way they related to the model. We first operationalized *cosmopolitanism* as a continuous variable (the linear addition of *number of languages currently spoken*, *number of countries lived in*, *number of languages spoken before age 13*, and *number of countries educated in*) because we believed that a combination of experiences contribute to the development of cosmopolitanism. We did not hypothesize that job complexity would affect the relationships between cosmopolitanism and any of the other variables in the model. Hypotheses 4.1, 4.4, and 4.6 were examined using an additive variable—*cosmopolitanism*. Results indicated that an individual's level of cosmopolitanism was negatively related to the bosses' ratings of internal relationships ($r = -.182$, $p < .015$), but was not related to bosses' ratings of other criterion variables (Hypothesis 4.1). These results suggested that people with higher cosmopolitanism scores were at a disadvantage with their bosses because their bosses perceived them as being less proficient at internal relationships than those with lower cosmopolitanism scores.

Results for hypotheses related to early and adult life experience (4.2, 4.3, 4.5, and 4.7) are shown in Tables 4.1–4.3. In Table 4.1 zero-order correlations between experience variables and effectiveness criteria are presented. Hypothesis 4.2 was not supported. In fact, for managers in the high global condition, *number of countries educated in* and *number of languages spoken as a child and as an adult* were negatively correlated with the criterion measures *interpersonal relationships* and *contextually adept*. *Number of countries educated in* was also negatively correlated with *interpersonal relationships* for managers in domestic jobs. For the local-boss ratings, *time in role* was negatively correlated with *interpersonal relationships*.

Hypothesis 4.3 was not supported (see Table 4.2). Results indicated that cosmopolitanism was not correlated with *openness* ($r = .067$, $p < .332$). This result suggested that *openness* as measured in the NEO PI-R was not necessarily related to the type of past international experience captured by the cosmopolitanism variable. Hypothesis 4.4, which predicted an association between adult life experience and the trait *openness*, was also not supported.

As seen in Table 4.3, Hypothesis 4.5 was supported. Results indicate that *cosmopolitanism* is positively correlated with *international business knowledge* ($r = .481$, $p < .001$) and *cultural adaptability* ($r = .388$, $p < .001$). This result suggested that *international business knowledge* and *cultural adaptability* were related to the type of past international experience captured by the cosmopolitanism variable and is useful with regard to specific competency areas that individuals can develop.

Table 4.1

**Early Life and Adult Life Experience Correlations with Boss Effectiveness Ratings
for Managers in Low and High Global Contexts**

Low global context n = 101	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Languages spoken between ages 1–13	.00	–.05	–.02a	–.03a	.05a
Languages spoken as adult	.07	–.04	.10a	.09a	.07a
Number of countries lived in	–.02	–.04	–.02a	–.03a	–.04a
Number of countries educated in	–.01	–.08	.03a	.10a	.11a
Years of formal education	–.13	–.09	–.01	–.05	–.05
Time in role	–.19	**–.21**	–.11	–.06	–.12
Tenure	–.03	.02	–.11	–.04	.04
Expatriate	a	a	a	a	a
High global context n = 80	**Managing and leading**	**Interpersonal relationships**	**Knowledge and initiative**	**Success orientation**	**Contextually adept**
Languages spoken between ages 1–13	–.14	**–.30**	.07a	.03a	–.05a
Languages spoken as adult	–.10	**–.21**	.14a	–.06a	.00a
Number of countries lived in	–.08	–.09	.04a	.08a	–.08a
Number of countries educated in	–.18	**–.24**	–.03a	–.05a	**–.25**a
Years of formal education	.10	–.01	.02	.17	–.05
Time in role	.13	–.03	.17	.06	.13
Tenure	.09	.09	.11	.09	.07
Expatriate	a	a	a	a	a

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Table 4.2

Early Life and Adult Life Experience Correlations with Personality Scales
for Managers in Low and High Global Contexts

Low global context *n* = 101	Neuroticism	Extraversion	Openness	Agreeableness	Conscientious
Languages spoken between ages 1–13	.01	–.02	.08a	–.17	–.11
Number of countries lived in	–.10	.08	.11a	–.17	.11
Expatriate	.10	–.01	.03	**.23**	–.17
High global context *n* = 80	Neuroticism	Extraversion	Openness	Agreeableness	Conscientious
Languages spoken between ages 1–13	.00	.10	.02a	.00	.05
Number of countries lived in	–.07	–.08	–.04a	.00	.08
Expatriate	.10	–.01	.03	**.23**	–.17

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Hypothesis 4.6 was partially supported. *Number of countries educated in* was positively correlated with the capabilities of *cultural adaptability* and *international business knowledge* for all managers. *Number of languages spoken between ages 1–13* was only associated with *cultural adaptability* and *international business knowledge* for managers working in a high global context.

Hypothesis 4.7 was supported for high-global-context managers and partially supported for low-global-context managers. In other words, for managers in either context, experience as an expatriate was associated with the skill of *cultural adaptability*. It was not related to *international business knowledge* for low-global-context managers but was for high-global-context managers.

Another interesting outcome is that bosses perceived people with high cosmopolitanism scores as being less proficient with internal relationships. This is particularly interesting given the relationship between *cultural adaptability* and bosses' positive evaluation of the managers. This result may suggest that bosses are uncomfortable with people with a cosmopolitan orientation, even though it is related to precisely the competencies considered necessary for success in a globally complex job.

Table 4.3
Early Life and Adult Life Experience Correlations with Selected Capabilities
for Managers in Low and High Global Contexts

Low global context *n* = 101	Perspective taking	Cultural adaptability	International business knowledge
Languages spoken between ages 1–13	a	a	a
Expatriate	–.02	**–.27**a	.03a
High global context *n* = 80	**Perspective taking**	**Cultural adaptability**	**International business knowledge**
Languages spoken between ages 1–13	a	a	a
Number of countries lived in	a	a	a
Expatriate	.07	**–.21**a	**–.28**a

Note: a indicates hypothesized relationships. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20. The negative relationship between expatriate experience and cultural adaptability is the result of coding.

CHAPTER 5
Experience—The Influence of Diversity on Managerial Effectiveness

Demographic changes all over the world have intensified the cultural diversity of today's labor force. Concurrently, a shift has occurred toward more complex jobs and roles in multinational corporations. The increased complexity of roles and increased interactions among diverse people has yielded practical concerns regarding the influence of diversity on individual and group effectiveness. Whether or not perceived similarity among group members affects workgroups' outcomes is a target of a considerable amount of research. The relative distance between members who are perceived to be in-group members ("one of us") versus those who are perceived as outsiders ("one of them") has been shown to have both adverse and positive consequences. But what influence does organizational diversity exert upon the perceptions of success at domestic and global work?

This chapter focuses on how experience with diversity influences social behavior in global organizations and in the perceptions of a manager's effectiveness. We present several theoretical propositions that explain how individuals relate to those who are different from and similar to themselves. We also explore how working with heterogeneous workgroups affects long-term success and the impact of the manager's "fit" in culturally diverse organizations.

Background

We have used *diversity* to refer to situations in which managers are not alike with respect to some attribute(s). At an individual/interpersonal level, one can view diversity in several ways. One way is through one's own *ethnocentrism* (the tendency to judge other cultures by one's own standards). To eliminate ethnocentrism, one must reject one's own culture—a very rare occurrence even for individuals who spend a considerable amount of time outside of their native country (Triandis, 1995). Another view of diversity is based on beliefs of perceived similarity. On one hand, in a homogeneous environment an individual has a very narrow range of attributes that define who comprises the in-group. On the other hand, in a heterogeneous environment the range of attributes that distinguish in-group members from outsiders is much larger.

Many theorists and researchers have addressed the construction of the self in relationship to the group. In the context of global organizations, one might assume that individuals would have at least three reference groups (a group to which people refer when making evaluations about themselves and their behavior): one belonging to their native culture, one belonging to the culture with which they come in contact (Ferdman, 1995), and one belonging to the organizational culture. LaFrombosie, Coleman, and Gerton (1993), in a review of the literature, identified five types of models used to describe psychological processes, social experiences, and general obstacles in the context of biculturalism, and more models exist (see, for example, Cox, 1993). But those studies have not addressed the implications of one's identity on effectiveness, most particularly when the context of that effectiveness is a global organization.

Researchers have frequently used the social identity and social categorization process, the similarity-attraction paradigm, informational and decision-making theories, and the degree of distinctiveness (Williams & O'Reilly, 1998) to explain the effects of diversity on organizational effectiveness.

Social identity and social categorization refer to the process whereby people derive at least part of their identity from the social categories to which they belong, using those categories to categorize others as similar or different from themselves. Arbitrarily categorizing people based on perceived differences can lead to trust and cooperation conflicts between in- and out-group members (Brewer, 1979, 1995).

The similarity-attraction paradigm has suggested that similarity between people produces positive effects by validating the perceiver's worldview. "Presumably, similarity in demographics leads to an inference or assumption about similarity in values, beliefs, and attitudes. . . . Furthermore, a presumed knowledge of the other individual's values, beliefs, and attitudes leads to a sense of predictability, comfort, and confidence regarding the other individual's likely behavior in the future" (Tsui, Xin, & Egan, 1995, p. 108). Some research has shown demographic similarity to be related to more frequent communication and friendship ties (Lincoln & Miller, 1979), frequency of technical communication (Zenger & Lawrence, 1989), and social integration (O'Reilly, Caldwell, & Bartette, 1989). In other words, research has supported the belief that workplace homogeneity makes communication and relationships easier.

Informational and decision-making theories (Tziner & Eden, 1985) have suggested that group heterogeneity can have a positive impact through the increase in the skills, abilities, information, and knowledge that diversity brings to the group. When the task or work can benefit from multiple perspectives and diversified knowledge, diversity can have a positive impact.

Lastly, the degree-of-distinctiveness theory has suggested that the more distinctive an individual is, the more self-aware he or she will become. That individual's self-awareness in turn leads him or her to compare his or her behavior to the norms of the group. According to Thomas, Ravlin, and Wallace (1996), a large cultural difference could result in unsuccessful adaptation or decreased effectiveness due to the perceived effort required just to fit in with the group.

The depth and breadth of the literature on the influence of diversity has directed our attention toward two particular aspects: the influence of experience working in heterogeneous work groups and the influence of organizational demography on effectiveness. Phrased another way, we wanted to know if experience in managing a diverse workgroup in a domestic role increases the likelihood that an individual will be effective in a global role. We also wanted to know if experience, as part of a demographic cohort, impacts perceptions of a manager's effectiveness.

Hypotheses

Influence of experience working in heterogeneous workgroups. It can be argued that managers who have had positive experiences managing domestic heterogeneous workgroups (workgroups composed of members who are different in demographic and cultural characteristics) could also be effective in an international assignment. We have indicated that relationship on our conceptual model (see Figure 5, p. 43). Experience working with diverse workgroups may indeed become the foundation for developing interpersonal skills that are effective and appropriate for working across cultural and geographic boundaries. The literature has suggested that skills which are helpful in interacting with people from other cultures can be learned by working with heterogeneous groups (Cox & Beale, 1997; Jackson, Brett, Sessa, Julin, & Peyronnin, 1991; Jackson, May, & Whitney, 1995; Sessa & Jackson, 1995). Scholars have argued that demographically diverse workgroups offer different perspectives, attitudes, and abilities: "Differences in experiences and perspectives lead team members to approach problems and decisions drawing on different information, from different angles, and with different attitudes. Therefore teams composed of people with diverse backgrounds and characteristics are expected to produce a wider variety of ideas, alternatives, and solutions—and thus perform better—than teams composed of people who are similar in terms of demographic characteristics" (Sessa & Jackson, 1995, p. 140). Research has also supported the link between group diversity and a positive impact on group effectiveness (Sessa & Jackson, 1995). Short-term outcomes of working with heterogeneous groups include the raising of self-awareness and increased social familiarity (Jackson et al., 1995).

The study of how a manager's previous work history with heterogeneous workgroups affects the development of interpersonal skills and the capacities required in a global role is new. But because we assumed that working with a heterogeneous workgroup leads to the development

of these skills, two conclusions were possible: (1) domestic or local managers who excel in this area may be particularly well suited for global leadership assignments, and (2) working with heterogeneous groups can be used for development of skills that impact effectiveness. Therefore,

> HYPOTHESIS 5.1: When the work is more globally complex, managers with a history of working in heterogeneous workgroups in their most recent domestic job will have higher scores on all effectiveness criteria than will their counterparts without this history.

There was substantial evidence, however, that suggested that increased diversity in workgroups has negative effects on the ability of the group to function effectively over time (Williams & O'Reilly, 1998). Diverse groups are more likely to have difficulty integrating, communicating, and resolving conflict. As the work becomes more global (that is, as time, geography, and cultural distance expand), maintaining workgroup cohesiveness becomes even more complex.

The influence of organizational cohort homogeneity. In addition to the impact of a manager's work history with heterogeneous workgroups, we believed the manager's similarity to colleagues was an important factor in trying to understand perceptions of success. Exploration of the relationship of demographic variables and workers' attitudes has had a long tradition in industrial and organizational psychology, social psychology, and sociology. Very few studies have examined how variations in multiple demographic variables affect work effectiveness, in particular the effectiveness of managers working in global organizations.

Organizational demography (Pfeffer, 1981, 1983) has treated demographic variables as a compositional property of the group or unit by measuring the variance in demography within the unit and relating this unit property to unit outcomes.[1] That compositional component has distinguished it from other demographic approaches.

Two main contributions have typically characterized organizational demography research: compositional variables (such as relative homogeneity or heterogeneity) and methodological ease (Lawrence, 1997). Researchers have mapped most often the relationship between demographic variables and organizational outcomes. The relationship between the demographic predictor and the outcome has been reflected in the literature as a varied assortment of theoretical explanations. Relational demographers have treated demography as a group-level variable but have also analyzed it at the individual level (Tsui & O'Reilly, 1989). "In these studies, the relative similarity or dissimilarity of specific demographic attributes of group members is related to individuals' attitudes or behaviors" (Thomas, Ravlin, & Wallace, 1996, p. 3).

---

[1] In organizational demography, there are two ways to define the unit of analysis: individual-level similarity or dissimilarity, and unit level. The individual measure compares all members of the group to each other so that each individual receives a score. At the unit level, the whole group gets a score.

Lawrence (1997) characterized five defining boundaries of organizational demography: (1) the demographic unit selected for the study, (2) the attributes of the demographic unit, (3) the domain in which the attributes are studied, (4) the measures of the attributes, and (5) the mechanism by which the attributes predict outcomes. The demographic unit can range from small (such as an individual) to large (such as an industry). The unit is the entity to which theoretical generalizations are made. Attributes of the demographic unit are the characteristics used to depict the subject matter under study (such as organizational tenure). The domain is the context in which a demographic unit is studied. The domain's level of analysis is higher than or equal to the demographic unit under study. Domains also range in size from dyads or groups to organizational populations or industries. Measures of the attribute that depict the demographic unit or domain are either simple (such as the organizational tenure of an individual in a group) or compositional (such as the Euclidean distance of group members), depending on the level of analysis of the attribute.[2] The final characteristic of organizational demography, the mechanism, refers to the process by which the attributes predict outcomes. The mechanism may be either indirect or direct.

Explanations for the effects of demography on organizational outcomes have followed several avenues, including social identity and social categorization process (Tajifel, 1974; Tajifel & Turner, 1986; Turner, 1985, 1987), the similarity-attraction paradigm (Byrne, 1971), and the degree of distinctiveness (Mullen, 1983, 1987; Thomas, Ravlin, & Wallace, 1996).

Relevant variables for assessing demographic effects in international or global organizations have included the following: (1) the number of years with the company, (2) national culture, (3) educational background, (4) gender, (5) race, and (6) age. Although all of these demographic attributes are important, some may be more salient than others when it comes to understanding individuals' effectiveness or fit in the organization. Age, race, and gender, for example, are easily observable; tenure, education, or field of study are not. Following are highlights from past research and our thoughts on the relative importance of each demographic attribute.

Number of years with company. Most of the organizational demography studies have continued to use Pfeffer's index, the tenure or length-of-service distribution in an organization or its top-management team, as the demographic variable of primary interest.[3] Effectiveness measures examined across these studies have varied. They have included turnover, innovation, diversification, and adaptiveness (Carroll & Harrison, 1998; Tsui, Egan, & Xin, 1995).

A preponderance of evidence has shown a positive relationship between organizational tenure and increased group effectiveness. Arguments for this positive relationship have been consistent with social categorization and similarity-attraction theories (Williams & O'Reilly, 1998). According to Tsui and O'Reilly (1989), the cause of the relational demographic effects are

---

[2] The Euclidean distance measure computationally is the square root of the individual's mean squared distance from the other members in the group on any demographic variable.

[3] The coefficient of variation in tenure has also become the most common measure of length-of-service heterogeneity. The measure is calculated as the standard deviation of tenure over the mean of tenure.

often attributed to a combination of high-level attraction based on similar experiences, attitudes, and values (see Byrne, 1971; Byrne, Clore, & Smeaton, 1996), and strong communication among the interacting members (Roberts & O'Reilly, 1979). As tenure in organizations increases, employees gain a better understanding of policies and procedures. In general, tenure acts as an indicator of organizational experiences (Zenger & Lawrence, 1989).

It may be that executives who are similar in their length of service to the organization have gained a better understanding of the organization through their shared experiences resulting in overall effectiveness. Based on this view, our resulting hypothesis was

> HYPOTHESIS 5.2: As the similarity of an individual's organizational tenure to that of others in a group increases, the perception of that individual's managerial effectiveness increases.

National culture. An increase in research on the impact of multicultural differences in organizational behavior has accompanied the rising number of companies expanding into international markets. Many of the studies have focused on cultural differences in terms of values, norms, and assumptions (Adler, 1991; Hofstede, 1980; Schwartz, 1994; Triandis, 1995). According to Triandis, Kurowski, and Gelfand (1994), to the extent that cultures share objective elements (such as language, religion, political systems, or economic systems) or subjective ones (values, attitudes, beliefs, norms, roles), they are considered similar. Triandis (1995) further concluded that different cultural groups have a higher chance of unification if they (a) share goals and equal status, (b) have a shared membership, (c) maintain frequent contact and a shared network, and (d) are encouraged by the organization to view each other in a positive light.

The more a person's national culture identity is distinct from others in the workgroup, the more difficult it will be for the members of the workgroup to perceive each other as similar. One might conclude that one of the most important factors in understanding diversity in international organizations is how national culture affects social behavior. A large cultural distance may in fact make individuals more self-aware, resulting in their having difficulty adjusting and being accepted by the workgroup. Thus:

> HYPOTHESIS 5.3: As the similarity of an individual's national culture to that of others in a group increases, the perception of that individual's managerial effectiveness increases.

Educational background. Educational achievement can be proxy for status and power within organizations. In the United States, for example, it is often assumed that senior-level people have more education than their direct reports. People believed to have different levels of education are often assumed to differ in their knowledge, skills, and abilities. It is not uncommon to find people who have similar educational backgrounds performing similar tasks within organizations.

Unlike the demographic attributes discussed previously, however, the literature has reported that increased diversity in educational background improves effectiveness (Hambrick, Cho, & Chen, 1996; Wiersema & Bantel, 1992) and in some cases communication (Glick, Miller, & Huber, 1993; Jenn, Northcraft, & Neale, 1997). Therefore,

HYPOTHESIS 5.4: As the dissimilarity of an individual's educational attainment (college degree, for example) to that of others in a group increases, the perception of that individual's managerial effectiveness increases.

Gender and race. There was enough support in the literature to treat gender and race effects separately. In the organizational demography literature, however, the two attributes often were examined together. Likewise, we have introduced them together in this report.

Gender and racial distinctiveness cannot be suppressed. The lack of representation of women and people of color in senior-level managerial positions has not gone unnoticed. For those who historically have been denied managerial opportunities and who have lacked clear role models from which to learn, two additional struggles were reported to have precedence. According to Ruderman and Hughes-James (1998), managing multiple identities and fitting in are particularly difficult for women and people of color as they develop their self-identities as leaders. Some research has suggested that for white women there is a limited range of acceptable behavior that is more stereotypically masculine than feminine (Morrison, White, & Van Velsor, 1992). Because of a lack of role models or coaches, people of color have to identify those acceptable behaviors themselves (Ruderman & Hughes-James, 1998).

Specific to the organizational demography literature, differences in gender and race were shown to relate negatively to psychological commitment and intent to stay, and positively to frequency in absence (Tsui, Egan, & O'Reilly, 1992). Konrad, Winter, and Gutek (1992) found that minority women were more likely to experience dissatisfaction and organizational isolation. In a more recent study, Tsui and Egan (1994) found no differences in the level of direct reports' citizenship behaviors when they were rated by a boss of the same race. White supervisors rated nonwhite subordinates lower than white subordinates, and white subordinates were rated highest by nonwhite supervisors.

To add to the confusion of the influence of diversity on workgroups, Wharton and Baron (1987), in an investigation of the effects of occupational gender desegregation of men, found that men in mixed-gender work settings reported significantly lower levels of satisfaction and a higher level of depression than men in either female- or male-dominated work settings. Further, they found that working among mixed-gender groups may take on different meanings for men than for women. Gender self-categorization for men appeared to be more important (for men, being male is more important than being female is for women), and gender was a symbolic representation of certain occupations—such as senior management—in organizations (Tsui, Egan, & O'Reilly, 1992). Because it is likely that an international organization will have a greater distribution of diversity in its workforce, we propose the following:

HYPOTHESIS 5.5: As the similarity of an individual's gender to that of others in a group increases, the perception of that individual's managerial effectiveness increases.

HYPOTHESIS 5.6: As the similarity of an individual's race to that of others in a group increases, the perception of that individual's managerial effectiveness increases.

Age. Similarly aged employees often have common experiences outside of work, which have tended to produce employees who share similar attitudes, beliefs, and interests inside and outside of the organization (Rhodes, 1983; Zenger & Lawrence, 1989). According to Zenger and Lawrence, "the youngest employees tend to be unmarried, and slightly older employees may be newly married with young children. Middle-aged employees may be divorced and have parents who need special care, and older employees tend to look forward to quiet lives without dependents and with grandchildren" (p. 365).

Studies have shown a positive relationship between age and job satisfaction (Hunt & Saul, 1975; Kalleberg & Loscocco, 1983), age and job involvement (Saal, 1978), age and commitment (Morris & Sherman, 1981), and age, tenure, and frequency of technical communication (Zenger & Lawrence, 1989). Tsui, Egan, and Xin (1995) pointed out that many organizational demography studies have included age and tenure as independent variables to test Pfeffer's (1983) tenure demography theory (see, for example, Bantel & Jackson, 1989; Murry, 1989; Jackson, Brett, Sessa, Julin, & Peyronnin, 1991; Tsui, Egan, & O'Reilly, 1992; Tsui & O'Reilly, 1989; Wagner, Pfeffer, & O'Reilly, 1984; Wiersema & Bantel, 1992; Zenger & Lawrence, 1989). Pfeffer argued that age and tenure distributions are not perfectly correlated and that they should be kept distinct.

In international organizations it may be that age similarity produces similarity in general attitudes about work that result in overall effectiveness. Therefore,

HYPOTHESIS 5.7: As the similarity of an individual's age to that of others in a group increases, the perception of that individual's managerial effectiveness increases.

Results and Discussion

The Euclidean distance formula was used to measure each individual's dissimilarity from the group on attributes, age, sex, race, country of current residence, and native country (see Jackson et al., 1991). The Euclidian distance provides a measure of the individual's dissimilarity from the group on each attribute individually, with possible scores for each attribute ranging from 0 (no difference from the group) to 1 (different from every member of the group). Zero-order correlations were conducted between demographic variables and effectiveness criteria.

The results of the influence of experience working in heterogeneous workgroups can be seen in Table 5.1. Hypothesis 5.1 was not supported.

Table 5.1

Heterogeneity of Group in Most Recent Domestic Job Correlated with Effectiveness Ratings for Managers in Low and High Global Contexts

Low global context *n* = 93	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Sex	.15	.15	.08	.01	.17
Residence	.03	.03	.02	−.01	.02
Race	**−.25**	−.20	−.14	−.09	−.10
Native country	−.02	.06	.06	.01	.09
Age	−.04	−.08	.05	.05	.04
High global context *n* = 68	**Managing and leading**	**Interpersonal relationships**	**Knowledge and initiative**	**Success orientation**	**Contextually adept**
Sex	−.14	−.03	**−.25**	**−.26**	−.12
Residence	.12	.05	.10	.11	.19
Race	.07	.14	−.06	.04	.07
Native country	.14	.22	.02	.23	.19
Age	.07	.03	−.04	.00	−.05

Note: All global relationships were hypothesized to be significant. Bold items are significant at the .05 level or greater and when the correlation is at a magnitude of at least .20.

Previous experience working with diverse groups does not enhance managerial effectiveness as expected. There is in fact a negative relationship between *boss effectiveness rating* and *experience managing people of a different gender* in the high global condition. Because 89% of our sample was male, it is most likely females who, on the basis of gender, reported high scores on *difference from others* in the former workgroup. Although men and women did not receive significantly different criterion scores from bosses, there was a trend for bosses to give lower scores to women than to men. It is unclear whether this result means that if a manager has experience working with people of the opposite sex that manager is less likely to be effective in a global role, or that women are more likely to receive low scores from their bosses than are men when the work is global in scope. The same line of thought holds for the significant finding regarding race for local managers.

The Euclidean distance measure was also used to test the influence of organizational cohort homogeneity on perceptions of effectiveness. For this analysis, however, individuals' demographic similarity with their cohort group (company) was examined within each participating organization. Because we framed our hypotheses in terms of similarity, we expected to find negative correlations. The results are displayed in Tables 5.2–5.5.

As shown in Table 5.2 less than half of the demographic variables were negatively correlated with bosses' ratings of effectiveness. We did find a modest but statistically significant association between an increase in *years of education distance* and bosses' ratings of individuals' *contextual adeptness* and *managing and leading*. In other words, managers who are different from their cohort in terms of their education were perceived to be more effective on two of the five criterion measures. Another statistically significant association was found among the cohort in company A's *native country distance* and *success orientation*. These results suggested that being dissimilar from others in terms of education and nationality may positively affect perceptions of effectiveness.

Table 5.2

Correlations Between Organizational Demographic Variables and Managerial Effectiveness for Company A

	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Age distance	−.15	−.15	−.10	−.18	.07
Native country distance	.17	.19	.11	**.25**	.09
Years with company distance	−.17	.03	−.03	−.03	−.12
Years of education distance	**.22**	.20	.12	.13	**.25**
Race distance	.09	.10	−.00	.15	.01
Sex distance	.07	.05	.01	−.03	.05

Note. Bold correlations are significant at the .05 level (2-tailed). Managers $N = 88$.

For the executive cohort in company B (Table 5.3), over half of the demographic variables were negatively correlated with bosses' ratings of effectiveness even though these relationships were not statistically significant. We did find a modest association between an increase in *years with the company distance* and a decrease in bosses' ratings of individuals' *interpersonal relationships.* That is, managers in company B who were different from their cohort in the number of years they had been with the company were perceived by their bosses to have poor interpersonal relationships.

For company C, over half of the demographic variables were negatively correlated with bosses' ratings of effectiveness, even though these relationships were not statistically significant (see Table 5.4).

Table 5.3

Correlations Between Organizational Demographic Variables and
Managerial Effectiveness for Company B

	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Age distance	.30	.20	.16	.24	.30
Native country distance	.19	.18	.04	.16	–.00
Years with company distance	–.30	**–.38**	–.15	–.21	–.16
Years of education distance	–.12	–.01	–.08	–.12	–.19
Race distance	A	A	A	A	A
Sex distance	–.16	.02	–.22	–.19	.01

Note: Bold correlation is significant at the .05 level (2-tailed). *A* cannot be computed because at least one of the variables is constant. Managers $N = 40$.

Table 5.4

Correlations Between Organizational Demographic Variables and
Managerial Effectiveness for Company C

	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Age distance	–.15	.08	–.03	.14	–.08
Native country distance	–.20	.09	–.09	–.18	–.10
Years with company distance	–.01	–.01	.06	–.00	.11
Years of education distance	.02	–.04	–.16	–.19	.00
Race distance	–.25	–.28	–.29	–.08	–.32
Sex distance	.11	.09	.00	.00	.24

Note: Managers $N = 35$.

Results for the last company in our study (labeled *D*) showed over half of the demographic variables were negatively correlated with bosses' ratings of effectiveness (these relationships were not statistically significant). We found one statistically significant association between an increase in *sex distance* and bosses' ratings of managers' *managing and leading* effectiveness. Phrased differently, as sex distance increases, perception of leadership effectiveness increases.

Table 5.5

Correlations Between Organizational Demographic Variables and
Managerial Effectiveness for Company D

	Managing and leading	Interpersonal relationships	Knowledge and initiative	Success orientation	Contextually adept
Age distance	–.00	.12	–.12	–.11	–.11
Native country distance	–.02	–.34	–.09	–.23	–.05
Years with company distance	.21	–.06	–.03	–.00	.06
Years of education distance	.05	.00	–.18	–.34	–.01
Race distance	–.04	–.42	–.20	–.34	–.05
Sex distance	**.44**	.38	.39	.24	.24

Note: Bold correlation is significant at the .05 level (2-tailed). Managers $N = 20$.

These results suggest that an individual's demographic difference from his or her cohort can affect perceptions of his or her effectiveness. Comparing the results across all four companies, being unlike others in terms of education and nationality may affect perceptions of effectiveness. These data also suggest that people who have been in a job for a long time are perceived by their bosses as less effective. More obviously, those who have achieved higher educational degrees than their cohorts are perceived by their bosses as being more competent. Finally, an individual's being different in gender from a predominantly male or female cohort increases bosses' effectiveness ratings.

CHAPTER 6
General Discussion and Conclusions

This report presents a conceptual model designed to help identify what it takes to be an effective global manager. The model is based on the literature and our experience working with international executives. With this research we have been able to help answer questions about roles, characteristics, traits, and experiences of effective global managers.

Returning to our conceptual model (see Figure 1 on p. 3), the antecedent variable *personality* does help to explain the kinds of managerial capabilities and role behaviors a manager is most likely to acquire. *Personality* is also associated with *managerial effectiveness* as predicted. *Personality* was not, however, related to a manager's previous work experience. Therefore, we have modified the model, as reflected in Figure 6 (p. 62), to reflect this change.

Experience, the other antecedent variable, was not a predictor of effectiveness. Its inclusion in the model, however, turned out to be more fruitful than we had anticipated. Our results revealed a paradox for managers who aspire to be global leaders. On one hand, exposure to other

Figure 6
A Conceptual Model of Predictors of Managerial Effectiveness in a Global Context (Revised)
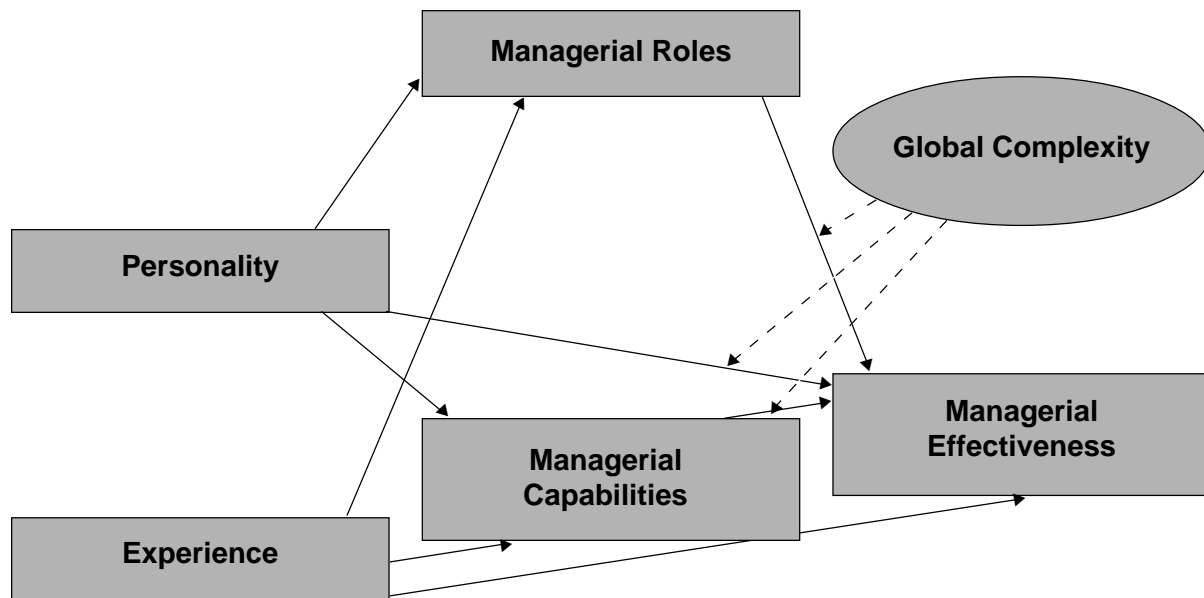

cultures is probably critical for developing the skills needed for global roles. Just as the personality variables share variance with many of the critical global skills, suggesting a link between traits and skill acquisition, a primarily post hoc review of the relationship between cosmopolitan experiences reveals a link between experience and skill set (see Appendices C and D). On the other hand, managers with these experiences were rated lower in some cases by their bosses on the interpersonal criterion measure (this phenomenon will be discussed more fully later in this section).

The remaining variables in the model, *managerial capabilities* and *managerial roles,* were in one form or another associated with *managerial effectiveness* as predicted.

We suggest that the revised model provides a useful heuristic to identify, appreciate, and explain the relationships among traits, experiences, skills, and capabilities needed to be an effective manager in a global role. These results show that as complexity accrues from the manager's simultaneously juggling time zones, country infrastructures, and cultural expectations, there is a shift in the skills, capacities, traits, and experiences needed for managerial effectiveness. We now turn our attention to the research questions for which the model was constructed.

What Do Global Managers Do?

The global executives we studied placed great importance on the roles of liaison (networking across organizational boundaries) and spokesperson, suggesting that as work responsibility shifts from domestic to global, managers place greater emphasis on external roles that take place

at the organization's periphery. Our global manager subjects also rated the managerial capabilities of *cultural adaptability, international business knowledge,* and *time management* as more important to their job than did local managers. These results track with our definition of a global manager—one who manages and leads across distance, borders, and cultural expectations. An intriguing outcome, worthy of further investigation, is that the roles and capabilities identified by global managers as most important to their work—liaison, spokesperson, and time management—were not the roles and capabilities that their bosses identified as significant to managerial effectiveness.

What Does It Take for a Manager to Be Effective when the Work Is Global in Scope?

The patterns of traits, role skills, and capabilities global managers need to be effective is similar to that of domestic managers. The bosses of global managers say emotional stability, skill in the roles of leader and decision maker, and the ability to cope with stress are key components to managerial effectiveness regardless of the job's global complexity. In addition, bosses look to conscientiousness, skill in the role of negotiator and innovator, business knowledge, international business knowledge, cultural adaptability, and the ability to take the perspective of others as significant to the effectiveness of global managers.

In regard to how personality relates to managerial effectiveness, emotional stability occupies an important place. It appears that the action roles (decision maker and negotiator) are relatively more critical to the global manager than to the domestic manager. The learning capabilities were also significantly more critical to effectiveness ratings for the global manager.

While these results may be intuitively satisfying, it is somewhat surprising that conscientiousness and business knowledge were not significantly related to effectiveness ratings for the domestic managers. (It's important to note, however, that all of these results could be an artifact of this particular sample.)

As for the relationship between experience and effectiveness, many of the results did not support our conjectures. Neither early exposure to other languages and cultures, experience living in other countries, multilingualism at work, nor past experience working with heterogeneous workgroups predicted effectiveness ratings in a global or domestic context. In fact, managers who fit the highly cosmopolitan profile (for example, those that were multilingual and widely traveled) were rated low by their bosses on how well liked and trusted their peers and other colleagues in their organizations found them to be. This finding revealed a paradoxical dark side for managers whose bosses perceived them as being cosmopolitan: exposure to other cultures through education, expatriate experience, language, and travel are critical to developing the skills needed to be an effective global manager, but these same factors are associated with negative ratings from bosses on at least one facet of effectiveness.

There are several possible explanations for this paradox. Ratiu (1983) has written that international executives are seen as being extremely effective but also as chameleon-like. In other words, the flexibility and innovation global managers bring to bear on their situations may contribute to their being seen as inconstant; therefore, they may be disliked and mistrusted by

other people in their organizations. Bennett's (1993) work on the effects of marginality also provides insight into this paradox. Her work describes how some individuals develop an identity that is independent of culture as a response to spending a considerable amount of time living in different cultures. Their cultural independence enables them to better negotiate between cultures, but at the same time their independence forces a wedge between their relationships and affects perceptions of effectiveness.

In investigating cohort homogeneity as one of the experience variables, we wanted to test the hypothesis that there are situations in which a boss's ratings of an individual's effectiveness may be influenced by how similar that individual is to other senior managers (in this case demographics—age, native country, company tenure, education, race, and gender). In three of the four companies, we found modest cohort effects, although not in the direction predicted. These results suggest that being unlike others in terms of education, nationality, gender, and tenure may affect bosses' perceptions of effectiveness.

How Can Organizations Best Select and Develop Effective Global Managers?

To answer this question it's necessary to simplify our initial model for understanding and position it as an integrated framework for development. Building upon the significant statistical, albeit modest, relationships that exist between bosses' effectiveness ratings and four pivotal skills (cultural adaptability, international business knowledge, perspective taking, and skill in the role of innovator), it's possible to extricate the skills and capabilities unique to the high-global-complexity condition. That is beyond the scope of this report. We have expounded on those ideas to create such a framework in *Success for the New Global Manager: How to Work Across Distances, Countries, and Cultures* (Dalton, Ernst, Deal, & Leslie, 2002).

Although practical uses of our model find their rightful home in that book, it's helpful here to discuss some of the relationships that emerged from our study. For example, readers should note the relationship between the five personality variables and the four pivotal skills. *Cultural adaptability* and *international business knowledge* are related to *neuroticism* (negatively) and *conscientiousness* (positively). This could be interpreted to mean that individuals who are able to tolerate the ambiguity and relativity of what they know *(neuroticism)* and who possess the determination and persistence to learn new ways of doing things *(conscientiousness)* may be more likely to acquire the knowledge and skills to do business in appropriate ways in other cultures. Individuals who have some appreciation for their own personality will have a greater appreciation for how hard or easy it might be for them to acquire the skills associated with cultural adaptability and international business knowledge.

Individuals who have high scores on the trait of *agreeableness* are more likely to be skilled at perspective taking (seeing the world through someone else's eyes). In other words, these managers have an inclination toward empathy. Although agreeableness is not directly related to effectiveness, it is related to skills associated with taking the perspective of others. One might surmise that managers with low *agreeableness* scores would have greater difficulty learning the skill of perspective taking.

Individuals who have high scores on the traits of *openness* and *extraversion* are also more skilled at playing the role of innovator. These managers are inclined to see novel associations and are able to persuade others to see these new possibilities. Again, knowledge of one's own personality preferences may help a manager more realistically set his or her development goals.

Looking at the experience variables *languages spoken*, *countries lived in*, and *past expatriate experience*, an individual with some measure of cultural adaptability and international business knowledge is also more likely to speak more languages, have lived in more places, and have been an expatriate. It is possible that these individuals can be encouraged to learn languages, to travel, and to seek out expatriate experience with a focused understanding of what is to be learned from such experiences. Finally, because the number of languages one speaks is statistically related to one's skill as an innovator, there is the intriguing possibility that managers who speak more than one language might also be those most inclined to see novel associations and make unique connections. This suggests that those managers who aspire to global jobs can gain benefits from trying to learn another language even if they never become proficient enough to conduct business in that language.

Certain skills and capabilities are common to managerial work whether that work is global or domestic. But subsequent examinations of culture tell us that these common characteristics play out differently as the cultural context, country infrastructure, and distance shift and interact. A manager (or anyone, for that matter) able to make that shift will have specialized knowledge and unique personal capabilities.

We propose that individuals wishing to develop such specialized knowledge and capabilities will benefit from understanding themselves and from knowing what experiences facilitate the development of this knowledge and these capabilities (travel, foreign language instruction, and expatriate experience, for example).

Limitations

Although the sample size is international, most cultural regions of the world are severely underrepresented. These data are also influenced by rater bias. Managers rated themselves on all of the personality, role, and capability scales. The shared variance among the independent variables interfered with our ability to use regression methodology.

Finally, the instrumentation was designed by Americans, and the surveys were administered in English. The criterion measures focused primarily on activities that occur inside of the organization, not on activities that occur outside or at the boundaries.

These limitations aside, this research is quantitative in an arena replete with best practices, interview data, and case studies of exceptional individuals. The project has considered and integrated a broad number of variables drawn from a range of theoretical perspectives that offer different kinds of relationships to managerial effectiveness criteria. The subject pool is international and the organizations represent a variety of industry types in diverse locations.

It is our hope that as we have built productively on work done by others, we have also cleared away some of the underbrush for those scholars and practitioners who will follow our investigation with their own.

Appendix A: Participant Background Form

1. How many years total have you been with this company? _____

2. What is your *current* job title and/or position? _____
    Please *briefly* describe your main responsibilities:

3. How many years have you been in your current role? _____

4. In how many countries are you a manager?
    [ ] one country—I am not an expatriate
    [ ] one country—I am an expatriate
    [ ] more than one country on the same continent and I am not an expatriate
    [ ] more than one country on the same continent and I am an expatriate
    [ ] more than one country on different continents and I am not an expatriate
    [ ] more than one country on different continents and I am an expatriate

5. In how many time zones do you work?
    [ ] 1   [ ] 4
    [ ] 2   [ ] 5
    [ ] 3   [ ] 6 or more

6. In the time zones that you do work, how many are more than an hour away?
    [ ] 1   [ ] 4
    [ ] 2   [ ] 5
    [ ] 3   [ ] 6 or more

7. Have you been an expatriate manager in the past?
    [ ] yes   [ ] no

8a. In the course of your work, how many languages do you speak?
    [ ] 1   [ ] 4
    [ ] 2   [ ] 5
    [ ] 3   [ ] 6 or more

8b. In your day-to-day life away from work, how many languages do you speak?
    [ ] 1   [ ] 4
    [ ] 2   [ ] 5
    [ ] 3   [ ] 6 or more

9. How many languages did you speak ages 1–13?
    [ ] 1   [ ] 4
    [ ] 2   [ ] 5
    [ ] 3   [ ] 6 or more

10. What is your native language? _____

11.   How many different countries have you lived in over your lifetime?
      [ ] 1   [ ] 4
      [ ] 2   [ ] 5
      [ ] 3   [ ] 6 or more

12.   In what country were you born? _____

13.   In what country do you *currently* live? _____
      For how many years? _____

14.   How many years of formal education have you completed?
      [ ] 10 years or less   [ ] 15 years
      [ ] 11 years   [ ] 16 years
      [ ] 12 years   [ ] 17 years
      [ ] 13 years   [ ] 18 years or more
      [ ] 14 years

15.   In your lifetime, how many countries were you educated in (please include all levels of
      schooling)?
      [ ] 1   [ ] 4
      [ ] 2   [ ] 5
      [ ] 3   [ ] 6 or more

16.   If you studied beyond secondary school (that is, beyond high school or Gymnasium level), what
      academic discipline was your main field of study (for example, engineering)?

      _____

17.   You are: [ ] Male   [ ] Female

18.   Your present age: _____

19.   Please describe your race or ethnic origin.
      [ ] Asian   [ ] Multi-racial
      [ ] Black   [ ] Other (please specify) _____
      [ ] White

Please think about the most recent position in which your responsibilities were domestic—responsible for only one country and you are/were not an expatriate.

What year(s) are/were you in this job? _____

Please think about the people whom you most closely worked with while in this position. Please answer the following questions with this group in mind. Do not indicate the names of the individuals about whom you are providing data.

Please list the business relationship of the ten people with whom you most closely worked (e.g., "This person was my boss/subordinate/peer"). Please complete the requested background information for the individuals listed. In the columns below, please write the letter of the appropriate response on the corresponding line for each individual. For Native Country and Country of Current Residence, write your answer in the space below.

	Race or Ethnic Origin a. Asian b. Black c. White d. Multi-racial e. Other	**Age** a. younger than me b. about my age c. older than me	**Native Country** (write in)	**Country of Current Residence** (write in)	**Functional area in which person has the most years of experience***
Sex a. female b. male					

Relationship:

1) _____ _____ _____ _____ _____ _____

2) _____ _____ _____ _____ _____ _____

3) _____ _____ _____ _____ _____ _____

4) _____ _____ _____ _____ _____ _____

5) _____ _____ _____ _____ _____ _____

*See next page for options.

	Sex a. female b. male	**Race or Ethnic Origin** a. Asian b. Black c. White d. Multi-racial e. Other	**Age** a. younger than me b. about my age c. older than me	**Native Country** (write in)	**Country of Current Residence** (write in)	**Functional area in which person has the most years of experience***
Relationship:						
6) _____	____	_____	____	____	____	____
7) _____	____	_____	____	____	____	____
8) _____	____	_____	____	____	____	____
9) _____	____	_____	____	____	____	____
10) _____	____	_____	____	____	____	____

*Functional area in which person has the most years of experience:

a. Accounting
b. Administration
c. Advertising/Public Relations
d. Credit/Finance
e. Education
f. Engineering
g. Human Resources/Training
h. Information
i. Law
j. Manufacturing
k. Marketing
l. Materials Management/Purchasing
m. Medicine
n. Operations
o. Product Development
p. Quality Control
q. Research/Analysis
r. Research and Development
s. Sales
t. Secretarial/Support
u. Security
v. Social Service
w. Systems Analysis
x. Top Management
y. Other

Appendix B: Scales and Alphas

ROLE BEHAVIORS

Managing Information

Monitor (Alpha .68)

1. Can seek information energetically.
2. Can probe, dig beneath the surface, test the validity of information.
3. Can create order out of large quantities of information.
4. Can spot problems, opportunities, threats, trends early.
5. Am logical, data-based, rational.

Spokesperson (Alpha .80)

1. Am crisp, clear, articulate.
2. Am skillful in speaking to external agencies or individuals.
3. Am a strong communicator.
4. Can effectively represent corporate interests at multiple levels of interaction in public and private sectors.
5. Can effectively act as agent and advocate for the organization.
6. Can effectively represent the organization at social or civic functions.

Managing Relationships

Leader (Alpha .90)

1. Am adept at establishing and conveying a sense of purpose within the organization.
2. Am a team builder; bring people together successfully around tasks.
3. Structure subordinates' work appropriately.
4. Recognize and reward people for their work.
5. Am effective at managing conflict.
6. Confront others skillfully.
7. Make good judgments about people.
8. Attract talented people.
9. Consider personalities when dealing with people.
10. Am a good coach, counselor, mentor; am patient with people as they learn.
11. Bring out the best in people.
12. Give subordinates appropriately challenging assignments and the opportunity to grow.
13. Make good use of people; do not exploit.
14. Am inspirational; help people to see the importance of what they are doing.
15. Am able to inspire, motivate, spark others to take action.
16. Delegate effectively.

Liaison (Alpha .75)

1. Possess an extensive network of contacts necessary to do the job.
2. Am skilled at selling upward, influencing superiors.
3. Establish strong collaborative relationships.
4. Effectively create alliances throughout the organization.
5. Effectively create alliances external to the organization.

Managing Action

Decision Maker (Alpha .87)

1. Am action oriented; press for immediate results.
2. Am decisive; do not procrastinate on decisions.

3. Am a troubleshooter; enjoy solving problems.
4. Can implement decisions, follow through, follow up well; an expediter.
5. Can make decisions rapidly when speed and timing are paramount.
6. Can make good decisions under pressure with incomplete information.
7. Can modify plans in response to changing conditions.
8. Can create significant organizational change.
9. Can introduce needed change even in the face of opposition.
10. Manage the process of decision making effectively; know who to involve on what issue.
11. Am comfortable with the power of the managerial role.

Innovator (Alpha .83)
1. Can form novel associations and ideas that create new and different ways of solving problems.
2. Can depart from accepted group norms of thinking and behaving when necessary.
3. Can try new approaches.
4. Am entrepreneurial; seize new opportunities.
5. Consistently generate new ideas.
6. Am good at promoting an idea or vision; persuading.

Negotiator (Alpha .79)
1. Carefully weigh consequences of contemplated action.
2. Can organize and manage big, long-term projects; have good shepherding skills.
3. Can translate strategy into action over the long haul.
4. Build work and management systems that are self-monitoring and can be managed effectively by remote control.
5. Establish effective management practices for directing employees I see only twice a month.
6. Negotiate adeptly with individuals and groups over roles and resources.
7. Carry out negotiations with multiple risk factors and unknowns.

PERSONALITY

Neuroticism (Alpha .80)

Extraversion (Alpha .74)

Openness (Alpha .74)

Agreeableness (Alpha .73)

Conscientiousness (Alpha .81)

MANAGERIAL CAPABILITIES

Knowledge
Business Knowledge (Alpha .78)
1. Am a good general manager.
2. Am effective in a job with a big scope.

3. Pick up knowledge and expertise easily in a new assignment.
4. Understand our business and how it works.
5. Understand cash flows, financial reports, corporate annual reports.
6. Tap local market knowledge and use it to underpin corporate strategy.
7. Am able to analyze and choose the best format for collaboration.
8. Know when and how to call on the specialized expertise of others.

International Business Knowledge (Alpha .91)

1. Can integrate local and global information for multi-site decision making.
2. Can discern and manage cultural influences on business practices and marketing.
3. Can create innovative corporate culture to leverage unique cultural-based knowledge and information for new product and service development.
4. Can negotiate effectively in different business environments, even with jet lag and through translation.
5. Can apply knowledge of public regulatory framework in multiple countries.
6. Am able to make deliberate choices about how to conduct business successfully in a given part of the world.

Learning Behaviors

Cultural Adaptability (Alpha .85)

1. Can effectively select and develop people in multiple cultural settings.
2. Can motivate multicultural teams effectively.
3. Can evaluate the work of others in a culturally neutral way.
4. Can inspire information sharing among individuals who do not know/see each other and who may represent different cultures.
5. Can adapt management style to meet cultural expectations.

Self-Development (Alpha .85)

1. Can compensate for my own weaknesses.
2. Can capitalize on my own strengths.
3. Respond well to new situations that require me to stretch and grow.
4. Learn from experience; am not set in my ways.
5. Make needed adjustments in my own behavior.
6. Am eager to learn and grow.
7. Seek out new and diverse work experiences.

Perspective Taking (Alpha .70)

1. Listen well.
2. Take into account people's concerns when trying to effect change.
3. Succeed in viewing a situation through other people's eyes.
4. Recognize the limits of own point of view.

Resiliency Behaviors

Managing Time (Alpha .79)

1. Can set priorities well; can distinguish clearly between important and unimportant tasks.
2. Can make the most of the time available; am extremely productive.
3. Can deal with interruptions appropriately; know when to admit interruptions and when to screen them out.
4. Avoid spreading myself too thin.
5. Am able to work on planes, in airports, in hotels.
6. Exhibit a high degree of comfort with high-tech communications.

7.   Can balance inflow of information from a variety of sources—voice mail, e-mail, fax, cellular phones, or pagers—with the need to get things done.

Managing Adversity (Alpha .68)

1.   Am capable, cool in high-pressure situations.
2.   Can deal well with setbacks; resilient; bounce back from failure, defeat.
3.   Am optimistic; take the attitude that most problems can be solved.
4.   Use constructive outlets for tension and frustration.

Integrity (Alpha .68)

1.   Am willing to admit ignorance.
2.   Have integrity; am trustworthy.
3.   Do not put my own ambitions ahead of the organization's objectives.

Criterion Effectiveness Measures

Managing and Leading (Alpha .87)

1.   Is able to establish and communicate common long-term goals.
2.   Is an expert communicator.
3.   Is an inspirational leader.
4.   Is an effective manager.
5.   Excels at selecting and developing good people.
6.   Consistently helps staff produce high-quality work.
7.   Establishes and maintains good relationships with subordinates.
8.   Is extremely effective in managing conflict to enhance the quality of the decision.

Interpersonal Relationships (Alpha .80)

1.   Works with senior managers effectively.
2.   Has excellent relationships within the company.
3.   Works well with peers and other departments to get the work done.
4.   Works extremely well as a team member.

Knowledge and Initiative (Alpha .78)

1.   Takes calculated entrepreneurial risks.
2.   Demonstrates independence and initiative.
3.   Has broad business knowledge of political, economic, and technological issues.
4.   Demonstrates confidence in the face of ambiguity.
5.   Is professionally competent.
6.   Has superior knowledge of the business.

Success Orientation (Alpha .68)

1.   Consistently drives for better outcomes.
2.   Meets company goals and expectations for the position.
3.   Could effectively handle the most senior position in the company.
4.   Uses the complexity of the job to help produce innovative outcomes.

Contextually Adept (Alpha .68)

1.   Is a good judge of character, even across cultures.
2.   Is effective at managing important external relationships.
3.   Uses cultural difference as a source of organizational strength.

Appendix G:
Hypotheses Organized by Questions of Interest

What do global managers do?

Managerial Roles

HYPOTHESIS 1.1: Managers in contexts of high global complexity will attribute more importance to the roles of monitor and spokesperson than will managers in contexts of low global complexity. (p. 14)

HYPOTHESIS 1.2: Managers in contexts of high global complexity will attribute more importance to the role of liaison than will managers in contexts of low global complexity, but managers in both contexts will perceive the role of leader equally. (p. 15)

HYPOTHESIS 1.3: Managers in contexts of high and low global complexity will perceive the roles of decision maker, innovator, and negotiator equally. (p. 16)

Managerial Capabilities

HYPOTHESIS 3.17: Managers in contexts of high global complexity will attribute more importance to the capabilities of *cultural adaptability* and *perspective taking* than will managers in contexts of low global complexity, but managers in either context will perceive the capability of *self-development* equally. (p. 37)

HYPOTHESIS 3.18: Managers in contexts of high global complexity will attribute more importance to the capability of *international business knowledge* than will managers in contexts of low global complexity, but managers in either context will perceive the capability of *business knowledge* equally. (p. 37)

HYPOTHESIS 3.19: Managers in contexts of high global complexity will attribute more importance to the capabilities of *time management* and *coping* than will managers in contexts of low global complexity, but managers in either context will perceive the capability of *integrity* equally. (p. 37)

What does it take for a manager to be effective when the work is global in scope?

Managerial Roles

HYPOTHESIS 1.4: The role of *monitor* will be related to the effectiveness criterion *contextually adept* for managers in contexts of low and high global complexity. (p. 17)

HYPOTHESIS 1.5: The role of *spokesperson* will be related to the effectiveness criterion *contextually adept* for managers in contexts of high global complexity. (p. 17)

HYPOTHESIS 1.6: The role of *leader* will be related to the effectiveness criterion *managing and leading* for managers in contexts of low global complexity. (p. 17)

HYPOTHESIS 1.7: The role of *liaison* will be related to the effectiveness criteria *contextually adept* and *interpersonal relationships* for managers in high-global-complexity jobs. (p. 17)

HYPOTHESIS 1.8: The role of *decision maker* will be related to the effectiveness criteria *knowledge and initiative* and *success orientation* for managers in low- and high-global-complexity jobs. (p. 17)

HYPOTHESIS 1.9: The role of *innovator* will be related to the effectiveness criterion *knowledge and initiative* for managers in low- and high-global-complexity jobs. (p. 17)

HYPOTHESIS 1.10: The role of *negotiator* will be related to all effectiveness criteria for managers in low- and high-global-complexity jobs. (p. 17)

Personality

HYPOTHESIS 2.1: Regardless of how globally complex the context is in which the manager works, *conscientiousness* will be positively associated with the effectiveness criteria *knowledge and initiative* and *success orientation*. (p. 25)

HYPOTHESIS 2.2: *Extraversion* will be positively associated with the managerial effectiveness criteria *managing and leading* and *interpersonal relationships* when the work is more globally complex. (p. 25)

HYPOTHESIS 2.4: *Agreeableness* will be positively associated with the managerial effectiveness indicators *managing and leading* and *interpersonal relationships* when the managerial work is more globally complex. (p. 26)

HYPOTHESIS 2.6: *Neuroticism* will be significantly and negatively correlated with all of the effectiveness criteria when the managerial work is more globally complex. (p. 26)

Managerial Capabilities

Learning Behaviors

HYPOTHESIS 3.1: *Self-development* will share significant variance with all effectiveness criteria for managers in the low-global-context group. (p. 31)

HYPOTHESIS 3.2: *Perspective taking* will share significant variance with the effectiveness criteria *managing and leading, interpersonal relationships, success orientation,* and *contextually adept* when the manager's work is more globally complex. (p. 33)

HYPOTHESIS 3.3: *Perspective taking* will be positively associated with the personality scale *openness*. (p. 33)

HYPOTHESIS 3.4: *Perspective taking* will be negatively associated with the personality trait *neuroticism.* (p. 33)

HYPOTHESIS 3.5: *Cultural adaptability* will share significant variance with the effectiveness criteria *managing and leading, interpersonal relationships, knowledge and initiative, success orientation,* and *contextually adept* when the work is more global in scope. (p. 34)

HYPOTHESIS 3.6: *Cultural adaptability* will be grounded in one's ability to manage the anxiety associated with the dissonant messages of the foreign workplace and thus will be highly correlated with emotional stability *(neuroticism)*. (p. 35)

Knowledge

HYPOTHESIS 3.8: *Business knowledge* will share significant variance with the effectiveness criteria *knowledge and initiative* and *success orientation* regardless of the global complexity of the job. (p. 36)

HYPOTHESIS 3.9: *International business knowledge* will share significant variance with the effectiveness criteria *knowledge and initiative* and *success orientation* when the manager's work is more globally complex. (p. 36)

HYPOTHESIS 3.10: The capability *insightful* will share significant variance with the effectiveness criteria *knowledge and initiative* and *success orientation* regardless of the global complexity of the job. (p. 36)

HYPOTHESIS 3.11: *Conscientiousness* will be related to bosses' ratings of *business knowledge* and *international business knowledge.* (p. 36)

Resilience

HYPOTHESIS 3.13: The ability to cope with stress will share significant variance with all effectiveness criteria when the manager's work is more globally complex. (p. 36)

HYPOTHESIS 3.14: *Integrity* will share significant variance with *managing and leading* and *interpersonal relations* regardless of global complexity. (p. 36)

HYPOTHESIS 3.15: The skill of *coping* will be negatively associated with the trait *neuroticism.* (p. 37)

HYPOTHESIS 3.16: *Time management* will be positively associated with *conscientiousness*. (p. 37)

Demographics

There are no hypotheses for the demographic variables. However, to the extent permitted by sample size, mean differences on boss and direct report criterion scores will be examined as a function of race, gender, age, and ethnicity of target manager. If indicated, these variables could then be used as covariates.

Experience
[Eventually the authors intend to combine these variables into a composite variable called *cosmopolitan*. However, in this paper they are to be considered as independent measures.]

HYPOTHESIS 4.1: *Cosmopolitanism* will be positively correlated with bosses' ratings of effectiveness. (p. 46)

HYPOTHESIS 4.2: Individuals who spoke/speak more languages in early life and adult life, who have lived in more countries, and who were educated in more countries will have higher scores on *knowledge and initiative, success orientation,* and *contextually adept* than individuals who have not had these experiences, regardless of the global complexity of their current jobs. (p. 46)

HYPOTHESIS 4.3: *Cosmopolitanism* will be positively related to the personality trait *openness*. (p. 46)

HYPOTHESIS 4.4: Managers who speak multiple languages and who have lived in multiple countries will have higher scores on the personality trait *openness*. (p. 46)

HYPOTHESIS 4.5: *Cosmopolitanism* will be positively related to self-ratings of the capabilities *perspective taking, cultural adaptability*, and *international business knowledge*. (p. 46)

HYPOTHESIS 4.7: Experience as an expatriate will be positively related to *international business knowledge* and *cultural adaptability*. (p. 47)

Early Life and Adult Life

HYPOTHESIS 4.6: *Number of languages spoken before the age of 13* and *number of countries educated in* will each be positively associated with the capabilities of *perspective taking, cultural adaptability,* and *international business knowledge*. (p. 46)

There are no hypotheses for variables related to *tenure* and *time in current role* but the authors plan to investigate these relationships in their future work.

Heterogeneity of Workgroup in Most Recent Domestic Job

HYPOTHESIS 5.1: When the work is more globally complex, managers with a history of working in heterogeneous workgroups in their most recent domestic job will have higher scores on all effectiveness criteria than will their counterparts without this history. (p. 53)

Organizational Demography

HYPOTHESIS 5.2: As the similarity of an individual's organizational tenure to that of others in a group increases, the perception of that individual's managerial effectiveness increases. (p. 55)

HYPOTHESIS 5.3: As the similarity of an individual's national culture to that of others in a group increases, the perception of that individual's managerial effectiveness increases. (p. 55)

HYPOTHESIS 5.4: As the dissimilarity of an individual's educational attainment (college degree, for example) to that of others in a group increases, the perception of that individual's managerial effectiveness increases. (p. 56)

HYPOTHESIS 5.5: As the similarity of an individual's gender to that of others in a group increases, the perception of that individual's managerial effectiveness increases. (p. 57)

HYPOTHESIS 5.6: As the similarity of an individual's race to that of others in a group increases, the perception of that individual's managerial effectiveness increases. (p. 57)

HYPOTHESIS 5.7: As the similarity of an individual's age to that of others in a group increases, the perception of that individual's managerial effectiveness increases. (p. 57)

What do organizations need to know and do in order to select and develop people who will manage and lead effectively in the global economy?

Personality and Its Relationship to Role Behaviors and Capabilities

HYPOTHESIS 2.3: *Openness* will be positively associated with the role behavior *innovator.* (p. 26)

HYPOTHESIS 2.5: *Agreeableness* will be positively associated with the role behavior skills that are related to managing people: *leader* and *liaison.* (p. 26)

HYPOTHESIS 3.7: *Openness* will be positively associated with the learning scale *cultural adaptability.* (p. 35)

Experience and Its Relationship to Role Behaviors and Capabilities

HYPOTHESIS 3.12: *Business knowledge* and *international business knowledge* will be positively associated with *conscientiousness.* (p. 36)

MANAGERIAL EFFECTIVENESS IN A GLOBAL CONTEXT

The rapid expansion of globalization and multinational corporations means more and more managers work across the borders of multiple countries simultaneously. Some of them are expatriates. Most are not. And although many of these managers are not wrestling with the issues of relocating and adjusting to living in a different culture, they all find themselves dealing with cultural issues—defined in the broadest context—every time they pick up the phone, log onto their e-mail, or disembark from an airplane. What do these managers do? Is it different from the work they did when they managed in their own countries, and if it is different, how so? What does it take for them to be effective when they manage across so many countries simultaneously? What do these managers need to know in order to be effective? What do organizations need to know and do in order to select and develop people who will manage and lead effectively in the global economy? This report addresses those questions as it documents the findings of a Center for Creative Leadership research study into what factors might predict managerial effectiveness in a global context.

Although this report is written for scholars, the practical implications of the work have been published in *Success for the New Global Manager: How to Work Across Distances, Countries, and Cultures* (2002, Jossey-Bass and Center for Creative Leadership).

The Authors

Jean Brittain Leslie is manager of instrument development research in CCL's products group and instructor of CCL's Benchmarks® Certification Workshop. She is the coauthor of several CCL publications, including *A Look at Derailment Today: North America and Europe*. She holds an M.A. in sociology from the University of North Carolina at Greensboro.

Maxine Dalton is group director of CCL's Leading in the Context of Difference practice area, in which she manages research and development projects related to understanding how people become effective leading others who are different from them on some major social dimension. She has written extensively about global issues and other subjects, and holds a Ph.D. in industrial/organizational psychology from the University of South Florida.

Chris Ernst is a research associate at CCL and focuses on the changing role of leadership in a globally connected world. He is the coauthor of several articles and a frequent presenter on the subject of global issues. His Ph.D. in industrial/organizational psychology is from North Carolina State University.

Jennifer Deal is a research scientist at CCL with interests in global leadership, generational issues of leadership, and other facets of leadership development. She is the author and coauthor of several works related to executive selection, global management, and other issues. She holds a Ph.D. in industrial/organizational psychology from The Ohio State University.
